Microsoft Windows and MS-DOS are registered trademarks of Microsoft Corp.

All other product names or trademarks are properties of their respective owners.

Product Warranty (2 years)

Advantech warrants to you, the original purchaser, that each of its products will be free from defects in materials and workmanship for two years from the date of purchase.

This warranty does not apply to any products which have been repaired or altered by persons other than repair personnel authorized by Advantech, or which have been subject to misuse, abuse, accident or improper installation. Advantech assumes no liability under the terms of this warranty as a consequence of such events.

Because of Advantech's high quality-control standards and rigorous testing, most of our customers never need to use our repair service. If an Advantech product is defective, it will be repaired or replaced at no charge during the warranty period. For out-of-warranty repairs, you will be billed according to the cost of replacement materials, service time and freight. Please consult your dealer for more details.

If you think you have a defective product, follow these steps:

1. Collect all the information about the problem encountered. (For example, CPU speed, Advantech products used, other hardware and software used, etc.) Note anything abnormal and list any onscreen messages you get when the problem occurs.
2. Call your dealer and describe the problem. Please have your manual, product, and any helpful information readily available.
3. If your product is diagnosed as defective, obtain an RMA (return merchandise authorization) number from your dealer. This allows us to process your return more quickly.
4. Carefully pack the defective product, a fully-completed Repair and Replacement Order Card and a photocopy proof of purchase date (such as your sales receipt) in a shippable container. A product returned without proof of the purchase date is not eligible for warranty service.
5. Write the RMA number visibly on the outside of the package and ship it prepaid to your dealer.

Declaration of Conformity

CE

This product has passed the CE test for environmental specifications when shielded cables are used for external wiring. We recommend the use of shielded cables. This kind of cable is available from Advantech. Please contact your local supplier for ordering information.

CE

This product has passed the CE test for environmental specifications. Test conditions for passing included the equipment being operated within an industrial enclosure. In order to protect the product from being damaged by ESD (Electrostatic Discharge) and EMI leakage, we strongly recommend the use of CE-compliant industrial enclosure products.

FCC Class A

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Technical Support and Assistance

1. Visit the Advantech web site at www.advantech.com/support where you can find the latest information about the product.
2. Contact your distributor, sales representative, or Advantech's customer service center for technical support if you need additional assistance. Please have the following information ready before you call:
 - Product name and serial number
 - Description of your peripheral attachments
 - Description of your software (operating system, version, application software, etc.)
 - A complete description of the problem
 - The exact wording of any error messages

Safety Instructions

1. Read these safety instructions carefully.
2. Keep this User Manual for later reference.
3. Disconnect this equipment from any AC outlet before cleaning. Use a damp cloth. Do not use liquid or spray detergents for cleaning.
4. For plug-in equipment, the power outlet socket must be located near the equipment and must be easily accessible.
5. Keep this equipment away from humidity.

6. Put this equipment on a reliable surface during installation. Dropping it or letting it fall may cause damage.
7. The openings on the enclosure are for air convection. Protect the equipment from overheating. **DO NOT COVER THE OPENINGS.**
8. Make sure the voltage of the power source is correct before connecting the equipment to the power outlet.
9. Position the power cord so that people cannot step on it. Do not place anything over the power cord.
10. All cautions and warnings on the equipment should be noted.
11. If the equipment is not used for a long time, disconnect it from the power source to avoid damage by transient overvoltage.
12. Never pour any liquid into an opening. This may cause fire or electrical shock.
13. Never open the equipment. For safety reasons, the equipment should be opened only by qualified service personnel.
14. If one of the following situations arises, get the equipment checked by service personnel:
 - The power cord or plug is damaged.
 - Liquid has penetrated into the equipment.
 - The equipment has been exposed to moisture.
 - The equipment does not work well, or you cannot get it to work according to the user's manual.
 - The equipment has been dropped and damaged.
 - The equipment has obvious signs of breakage.
15. **DO NOT LEAVE THIS EQUIPMENT IN AN ENVIRONMENT WHERE THE STORAGE TEMPERATURE MAY GO BELOW -20° C (-4° F) OR ABOVE 60° C (140° F). THIS COULD DAMAGE THE EQUIPMENT. THE EQUIPMENT SHOULD BE IN A CONTROLLED ENVIRONMENT.**
16. **CAUTION: DANGER OF EXPLOSION IF BATTERY IS INCORRECTLY REPLACED. REPLACE ONLY WITH THE SAME OR EQUIVALENT TYPE RECOMMENDED BY THE MANUFACTURER, DISCARD USED BATTERIES ACCORDING TO THE MANUFACTURER'S INSTRUCTIONS.**
17. The sound pressure level at the operator's position according to IEC 704-1:1982 is no more than 70 dB (A).

DISCLAIMER: This set of instructions is given according to IEC 704-1. Advantech disclaims all responsibility for the accuracy of any statements contained herein.

Safety Precaution - Static Electricity

Follow these simple precautions to protect yourself from harm and the products from damage.

- To avoid electrical shock, always disconnect the power from your PC chassis before you work on it. Don't touch any components on the CPU card or other cards while the PC is on.
- Disconnect power before making any configuration changes. The sudden rush of power as you connect a jumper or install a card may damage sensitive electronic components.

Chapter 1

Overview

1.1 Introduction

Advantech's EKI-1521, EKI-1522, and EKI-1524 series of Industrial Device Servers (the following manual will use EKI-152X series instead of complete model name) are a robust, feature-rich, and cost effective way to network-enable equipment in an industrial automation environment. The EKI-152X series provides one, two, or four serial ports, two independent Ethernet ports, a wide range of power inputs, and a compact slim design, making them an ideal solution for connecting multiple asynchronous RS-232/422/485 serial devices to an Ethernet network.

The two Ethernet ports allow the EKI-152X series to establish two separate Ethernet connections to two Ethernet domain or two Ethernet Switches in the same domain. Through dual Ethernet connections, the EKI-152X series greatly improves the device connectivity reliability, increase system stability, and simplify the redundant configuration.

By encapsulating serial data and transporting it over Ethernet, the EKI-152X series allows virtual serial links over Ethernet and IP (TCP/IP, UDP/IP) networks. After Advantech Serial Device Server Configuration Utility installation, standard serial operation calls are transparently redirected to the serial device servers, guaranteeing compatibility with legacy serial devices and enabling backward compatibility with existing software. EKI-152X series also supports serial tunneling, allowing two native serial devices to communicate over a network without any hosts and programming. As a result, you can extend limited distance, point-to-point, direct serial connections within the plant, throughout the factory, the facility, the office building, or across the global enterprise.

The EKI-152X series provides an impressive list of features and functions enabling multiple industrial devices to be connected, controlled, configured, managed, and updated over a network. With serial ports and two auto-sensing Ethernet ports, the EKI-152X series can easily connects multiple serial devices to a network.

The transmission speed of the EKI-152X series is up to 1.2M bps totally outstripping the competition to meet the demand for high-speed exchange. Functionally transparent and efficient, the EKI-152X series is especially designed for remotely controlling and monitoring devices via the Internet.

Types of supported devices:

- Human Machine Interface (HMI)
- Programmable Controller(PLC)
- Flow meters
- Temperature / pressure monitoring equipment
- Gas leak detection device
- Scales
- Power monitoring equipment
- Data Acquisition Modules

EKI-152X series provides various TCP/UDP operations: COM port redirection (Virtual COM port), TCP server/ client and UDP mode. Serial devices can be connected by means of multi-access modes.

1.2 Features

- Expand up 4096 serial ports for one Windows 2000/XP/Vista/7 host
- Provides dual 10/100 Mbps auto-sensing Ethernet ports: establish two separate Ethernet connection
- Supports high transmission speed up to 921.6 Kbps
- Supports various operation mode: COM port redirection (Virtual COM port), TCP server/client, UDP server/client mode
- Supports LED indicators: easy to diagnose
- Supports integrated Configuration Utility and Port-Mapping Utility: easy to configure and manage 4096 COM ports and self-diagnostic
- Supports multi-access features: allows maximum of five hosts to access one serial port simultaneously
- Allows maximum 16 hosts to access TCP client and command response mode
- Easy to locate specific EKI-152X series serial device server
- Mounts on DIN rail, or panel
- Surge protection for RS-422/485 line and power supply
- SNMP MIB-II for network management

1.3 Specifications

LAN

- Ethernet: 10/100 Mbps auto sensing
- No. of Ports: 2
- Port Connector: RJ45
- Protection: Built-in 1.5 KV magnetic isolation

Serial Interface

- Interface: RS-232/422/485, software selectable
- No. of Ports:
 - EKI-1521: 1
 - EKI-1522: 2
 - EKI-1524: 4
- Port Connector: DB9 male
- Baud Rate: 50 bps to 921.6 Kbps
- Parity: None, Even, Odd, Space, Mark
- Data bits: 5, 6, 7, 8
- Stop bits: 1, 1.5, 2
- Flow control: RTS/CTS, XON/XOFF, DTR/DSR
- Signals:
 - RS-232: TxD, RxD, CTS, RTS, DTR, DSR, DCD, RI, GND
 - RS-422: TxD+, TxD-, RxD+, RxD-, GND
 - RS-485: Data+, Data-, GND
- Protection: 15 KV ESD for all signals, enhanced protection for RS-422/485 lines

Software

- Utility: Advantech Serial Device Server Configuration Utility
- Driver support: Windows 2000/XP/Vista/7, Windows Server 2003/2008, Linux
- Operation Mode:
 - COM port redirection (Virtual COM)
 - TCP/UDP server (polling) mode
 - TCP/UDP client (event handling) mode
 - Pair connection mode
- Configuration: Web interface, Windows utility, Telnet console
- Protocol: ICMP, IP, TCP, UDP, BOOTP, DHCP, Auto IP, Telnet, SNMP, HTTP, DNS, SMTP, ARP, NTP
- Management: SNMP MIB-II

General

- LED indicators:
 - System: Power, System Status
 - LAN: Speed, Link/Active
 - Serial: Tx, Rx

Power

- Power input: 12 to 48 VDC x 2
- Power connector: Terminal block
- Power Consumption:
 - EKI-1521: 2W
 - EKI-1522: 2.5W
 - EKI-1524: 4W
- Power Line Protection: 1 KV burst (EN61000-4-4), 0.5 KV surge (EN51000-4-5)

Environmental

- Operation Temperature: -10 to 60°C (14 to 140°F)
- Storage Temperature: -20 to 80°C (-4 to 176°F)
- Operating Humidity: 5 to 95% RH

Regulatory Approvals

- ECM: CE, FCC Part 15 Subpart B (Class A)
- Safety: UL (UL60950-1), Class I, Division 2

1.4 Package Check List

- 1 x EKI-1521/1522/1524 Serial Device Server
- 1 x RS-232 loopback DB9 tester
- Panel mounting bracket
- DIN-rail mounting kit
- CD-ROM for utility and user manual

Optional Accessory:

- OPT1-DB9-AE D-sub 9 (female) to terminal block connector (for EKI-1000 series RS-422/485 use)

Chapter 2

Getting Started

2.1 Understanding EKI-152X series

The EKI-152X series are network-based, serial device servers for connecting RS-232/422/485 devices, such as CNCs, PLCs, scales, and scanners, directly to a TCP/IP network. Once connected through EKI-152X series, the serial device will be able to send and receive data on a network like any other network device. It extends traditional COM ports of a PC with access over a TCP/IP network. Through networking, you can control and monitor remote serial devices either over a LAN or over the WAN. Since the EKI-152X series is connected through a TCP/IP network, you might need to know some basic facts about networking in order to get the server hooked up correctly.

2.1.1 Product Description

The EKI-152X series is designed to network-enable any RS-232/422/485 serial device and provide industry-grade hardware and easy-use software to make connecting serial devices to an Ethernet network a surprisingly simple process. These units immediately upgrade your existing serial devices for integration into the Internet world. The EKI-152X series features a lot of powerful functions such as: high speed data transfer, access-control, auto-detection of all EKI series products, remote connection from different network domain, remote firmware download, and more.

After the simple installation steps to attach your network and serial device to the appropriate connectors on the serial device servers and driver installation, you will then be able to communicate with the serial devices via its own application software and with the EKI serial device server. COM port redirector, TCP server mode, TCP client mode, UDP server mode, UDP client mode and Control mode are all different schemes to make a serial connection across using one or more Serial device server.

EKI-152X series provides dual Ethernet ports that can establish two physical Ethernet connections. Dual connection control enables an alternative backup session that host can connect to device server by the way of second connection while the primary connection should be lost or dropped.

Figure 2.1 Dual Ethernet Connections

2.1.2 COM Port Redirector (Virtual COM Port)

Advantech Serial Device Server Configuration Utility is a serial COM port redirector that creates virtual COM ports and provides access to serial device connected to Advantech serial device server. You can configure the serial device server and enable the Virtual COM port using one integrated utility. Advantech Serial Device Server Configuration Utility allows you to configure Microsoft applications to communicate with network enabled serial device servers as easily as if they were physically installed in or directly connected on the PC.

The Advantech redirector can create up to 255 virtual COM ports. Application on the host can open virtual COM port to access the serial device servers at the same time. The redirector will handle each active virtual COM port as a separate TCP connection to Advantech serial device servers.

Figure 2.2 COM Port Redirector

2.1.2.1 Normal Mode

The Advantech redirector connects the Advantech serial device servers while an application open the COM port and disconnects from the Advantech serial device servers when the application closes the COM port. The redirector uses TCP network connections to the Advantech serial device server to gain the access to the connected serial devices.

2.1.2.2 Multi-Access Mode (Shared COM port mode)

Most of serial devices are connected directly and physically to the PC serial ports via a cable. The operation system, ex. Windows XP, provides the COM ports that user's application can access, and control the serial device through the serial cable. This means that the serial device can be connected to one host and only one application on this host can handle input, output and control operation on this device.

If you want to run more than one applications to use a serial device, you can employ EKI serial device servers that provide a virtual COM port for a host or multi-hosts on an Ethernet network. EKI serial device server is located between hosts and serial devices. Each serial port on the EKI serial device server can allow max. five host connections through one Ethernet port or two Ethernet ports. There are two major operation modes for Multi-Access Mode. First one is broadcast mode; EKI serial device server handles a command from one application and replies the data from the serial port to all applications that are connecting this serial port. Another one is polling mode; EKI serial device server handles the command from one application and reply to this application only. Query from other applications must be queued and wait for current process completing.

Figure 2.3 Multi-Access Mode

By using a serial device server to share serial device, you eliminate the separate serial lines and serial devices that can be attached to individual hosts. Collecting the data from these serial devices become more easily and more effectively.

2.1.3 TCP Server Mode

In TCP server mode, you might initiate the TCP connection from host to EKI serial device server. This operation mode support max. five simultaneous connections for each serial port on EKI serial device server from one host or several hosts, however multi-hosts collect the data from one serial port at the same time

Figure 2.4 TCP Server Mode

2.1.4 TCP Client Mode

In TCP Client mode, the TCP connection will be established from EKI serial device server. This operation mode supports max.16 simultaneous connections for each serial port on EKI-152X series to one host or several hosts. You should configure the IP address and TCP port number of the network hosts which the EKI serial device server connect to using Advantech Serial Device Server Configuration Utility. After configuration, when EKI serial device server receives the data from serial port, the device server will employ the connection to hosts which are configured.

Figure 2.5 TCP Client Mode

2.1.5 Serial Tunneling Mode

Two native serial devices can communicate over an Ethernet network without any intermediate host PC and software programming. Serial Tunneling is very simple to use. You can use Advantech Serial Device Server Configuration Utility to designate one serial port as the tunneling master and another serial device server port as the tunneling slave.

Figure 2.6 Serial Tunneling Mode

2.1.6 UDP Server/Client Mode

UDP is used primarily for broadcasting messages over a network. In the UDP server mode, EKI-152X series access max. 8 hosts' UDP message. In the UDP client mode, EKI serial device servers transmit UDP message to max. 16 hosts simultaneously.

2.1.7 Control Mode

In controlling mode, the EKI serial device server presents a modem interface to the attached serial device: it accepts AT-style modem commands to connect / disconnect to other networking device. If you want serial device running application program to connect/disconnect to different devices by request, you can use controlling mode.

The controlling mode provides three kinds of modem AT-style commands. The serial devices can use these commands to control EKI-152X series connecting or disconnecting to remote networking devices. Thus intelligent serial devices such as stand-alone PLC will send /receive data to/from devices one by one via Ethernet.

2.2 Hardware

In this section, we will give you an overview of EKI-152X series hardware and installation.

2.2.1 LED Indicators

There are LEDs display the power status, network status, and serial communication status located on the front panel of EKI-1521, EKI-1522, and EKI-1524, each of them has its own specific meaning as below table.

Table 2.1: EKI-152X series LED Indicators

LED Name	LED Color	LED Description
P1	Green	Power 1 is on.
	Off	Power 1 is off, or power error condition exists.
P2	Green	Power 2 is on.
	Off	Power 2 is off, or power error condition exists.
Status	Orange	Blinking: System is ready. Steady on: The device server has been located by utility's location function.
	Off	System is not working.
Ethernet	Orange	Blinking: Ethernet port is transmitting or receiving data. Steady on: Ethernet has the good link for 10Mbps or 100Mbps operations.
	Green	On: 100Mbps Ethernet connection. Off: 10Mbps Ethernet connection.
Serial	Orange	Serial port is transmitting data.
	Green	Serial port is receiving data.
	Off	No data is transmitted or received through the serial port.

2.2.2 Dimensions (Units: mm)

2.3 Connecting Hardware

Next, we will explain how to find a proper location for your EKI-152X series, and then explain how to connect to the network, hook up the power cable, and connect to the EKI-152X series serial port.

2.3.1 Choosing the Location

Due to its versatility and innovative design, EKI serial device server can be:

- Fixed to a panel mount
- Fixed to a DIN-rail.

2.3.1.1 Panel/Wall Mounting

The EKI-152X series can be attached to a wall using the included metal brackets. Each bracket comes with four screws; and then you can install the device firmly via the components, please see the figure as below.

Figure 2.15 Combine the Metal Mounting Kit

2.3.1.2 DIN Rail Mounting

You can mount the EKI-152X series on a standard DIN-rail. Please screw the DIN-rail kit on the serial device server first.

First, hang the EKI-152X series to the DIN-rail with angle of inclination. See below figure.

Figure 2.16 DIN-rail Step 1

Then, let the device down straight to slide over the rail smoothly.

Figure 2.17 DIN-rail Step 2

2.3.2 Network Connection

EKI-152X series has 2x RJ-45 that support connection to 10 Mbps Ethernet, or 100 Mbps Fast Ethernet, and half or full duplex operation. EKI-152X series can be connected to other hubs or switches through a twisted-pair straight through the cable or a crossover cable up to 100m long.

2.3.3 Power Connection

The EKI-152X series supports dual 12 to 48 VDC power inputs and power-fail relay output.

Figure 2.18 Power Connector

You can connect an alarm indicator, buzzer or other signaling equipment through the relay output. The relay opens if power input 1 or 2 fails ("Open" means if you connect relay output with an LED, the light would be off).

2.3.4 Serial Connection

EKI-152X series provides one, two, or four ports DB9 (male) connectors. RS-232/422/485 pin assignments as below:

Table 2.2: EKI-152X series Serial Pin Assignments

Pin	1	2	3	4	5	6	7	8	9
RS-232	DCD	RX	TX	DTR	GND	DSR	RTS	CTS	RI
RS-422	TX-	-	-	TX+	GND	-	RX+	-	RX-
RS-485	DATA-	-	-	DATA+	GND	-	-	-	-

2.4 Installing the Configuration Utility

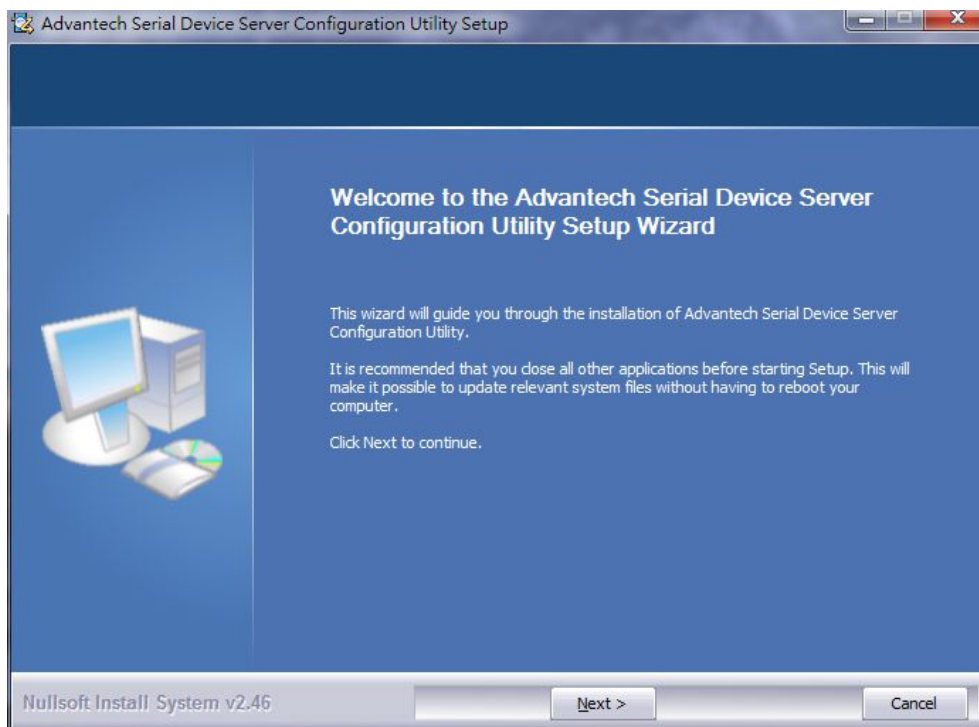

The following section will show you how to install the Advantech serial device server configuration utility, a tool to set up and monitor the EKI-152X series serial device servers.

Note! Be sure the Microsoft .NET Framework on your host PC is greater than version 2.0.

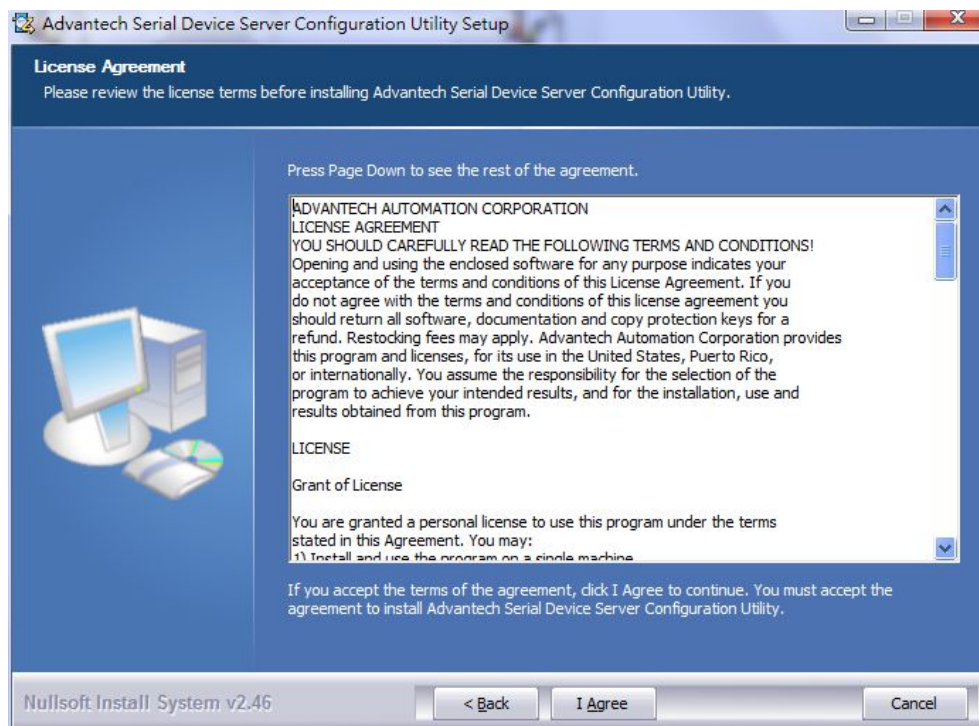

1. Insert the Advantech industrial communication IEDG series driver utility CD into the CD-ROM drive (e.g. E:\) on the host PC.
2. Use Windows explorer or the Windows Run command to execute the setup program, the path for the setup program on the CD-ROM should be: E:\Utility&Driver\SerialDeviceServerConfigurationUtility\Serial_Device_Server_Configuration_Utility_[Version]_Release_[date].exe

3. Upon executing the setup program, the Welcome Dialog Box will be pop-up. Press the "Next" button to continue.

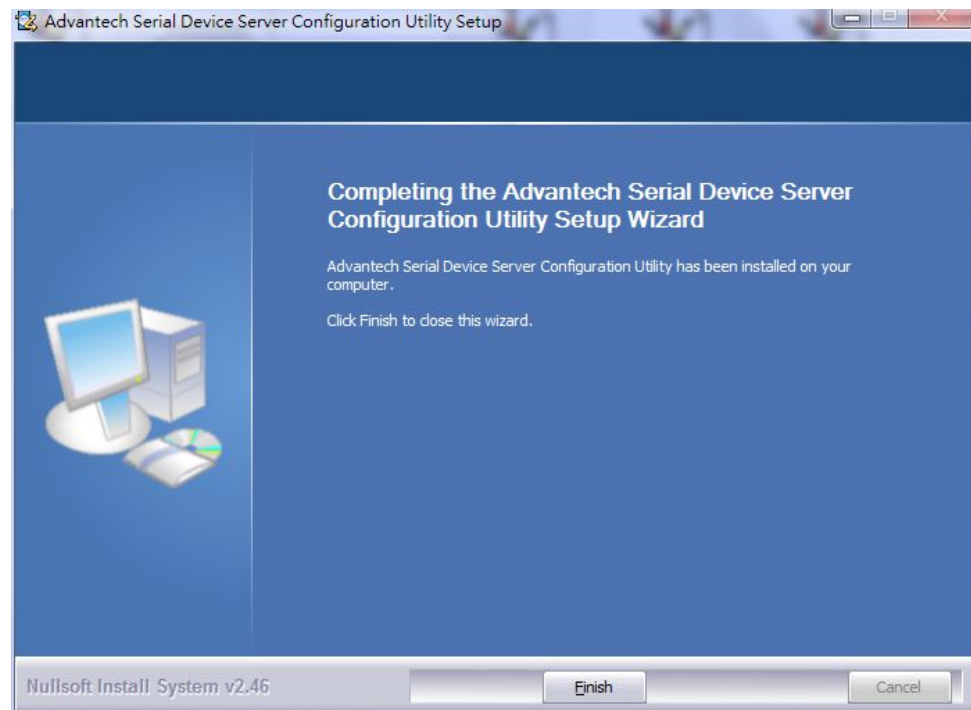

4. Carefully read the Software License Agreement, and press "Yes" to continue.

5. The Setup program will specify a default installation path: C:\Program Files\Advantech eAutomation\Serial Device Server Configuration Utility\

6. After setup has copied all program files to your computer, click the <Finish> button to finish the installation.

Chapter 3

Configuration

3.1 Configuration Utility Overview

EKI-152X series serial device servers provide an easy-to-use utility to configure your serial device server through an Ethernet connection. For secure administration, it can also restrict the access rights for configuration to only one host PC. With this secure function enabled, other PCs will not have permission for configuration. After the installation program on the Advantech IEDG Series Driver Utility CD-ROM is finished, the serial device servers will be ready for use and configure.

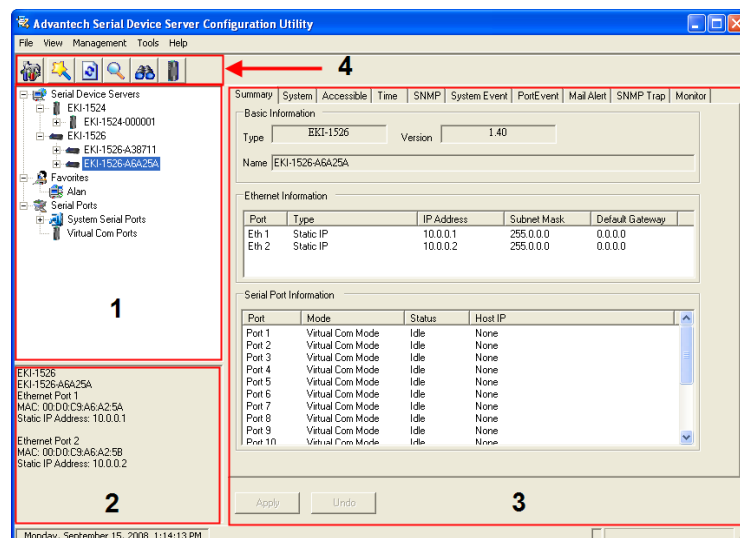

Advantech Serial Device Server Configuration Utility is an excellent device server management tool. You can connect and configure the local and remote Advantech serial device servers easily. Moreover, Virtual COM port will be enabled in the same utility. Using this utility, you can:

- Configure the network settings (you can set the IP address, Gateway address, and Subnet mask)
- View and set the serial port parameters (configure operating mode, baud rate, serial port settings and operating mode settings)
- Perform diagnostic tests (virtual COM port testing, port status list)
- Perform administrative functions (export and import the serial device server setting, manage access IP, a descriptive name, upgrade firmware)
- Configure COM port redirector (virtual COM port)

You may open the Serial Device Server Configuration Utility from the Windows Start Menu by clicking **Start → All Programs → Advantech eAutomation → Serial Device Server Configuration Utility**. The Serial Device Server Configuration Utility will appear as below.

There are four major areas in this new serial device server configuration utility.

1. Serial Device Server List Area: All devices will be searched and listed in this area. You can arrange different favorite group and virtual COM ports.
2. Serial Device Server Information Area: Click on the serial device server or move cursor to the serial device server, the related information will be shown on this area.
3. Configuration Area: Click on the item on the Device Server List Area, the configuration page will display on the area.
4. Quick Tool Bar: Useful management functions shortcut.

Note! Please reserve TCP/UDP port 5048 and 5058 in your Ethernet network, configuration utility will use these ports to communicate with Advantech EKI-1000, ADAM-4570, and EDG-4500 serial device servers.

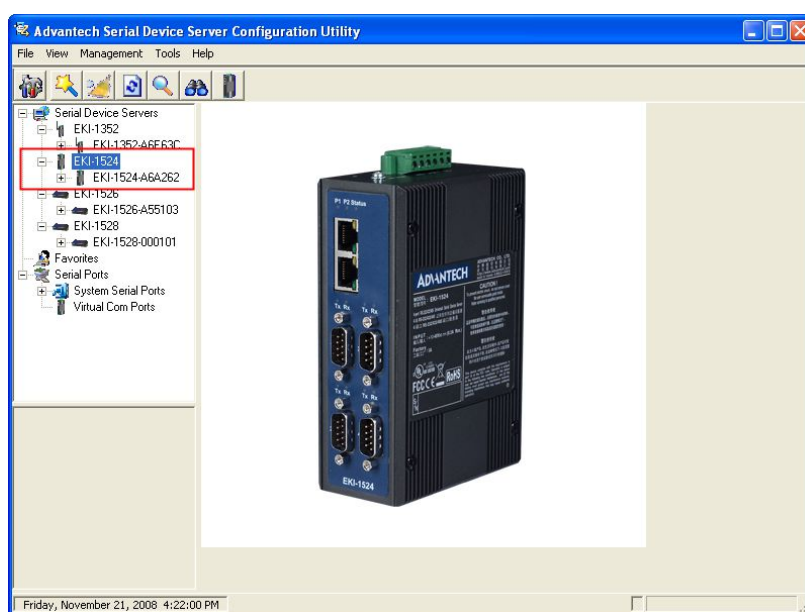

3.2 Discovering Serial Device Servers

3.2.1 Auto Searching

Advantech Serial Device Server Configuration Utility will automatically search all the EKI-1000, ADAM-4570 and EDG-4500 series device servers on the network and show them on the Serial Device Server List Area of the utility. The utility provides an auto-search function to show your device(s) by simply executing the configuration utility program from the **Start Menu**.

From here all device on the same network domain will be searched and display on Device Server List Area. You can click on the device name to show the features of the specific device. Click on the “+” before the model name (e.g. EKI-1524), and the utility will expand the tree structure to show the individual device name. Click on the “-” before the model name (e.g. EKI-1524), and the utility will collapse the tree structure.

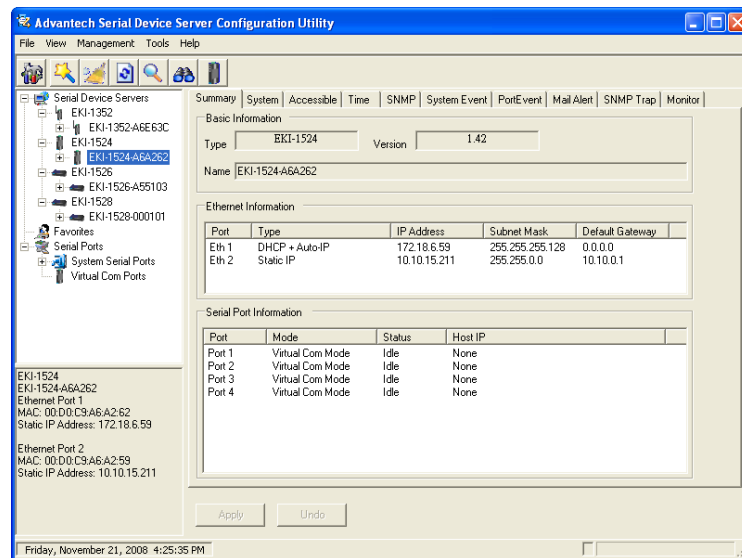

For example, the EKI-1524 in this figure is shown “EKI-1524-A6A262” after expanding the tree structure.

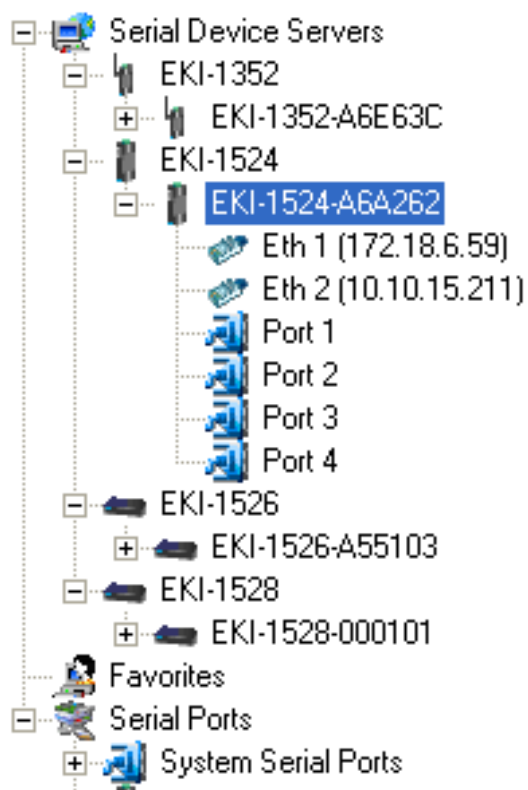

Note! When you run the Configuration Utility for the first time, the default device name is “MAC ID”. In this case, the device name “EKI-1524-A6A262” means the device “MAC ID” is “00 D0 C9 A6 A2 62”. You can change the default device name in the System Tab of Device Properties.

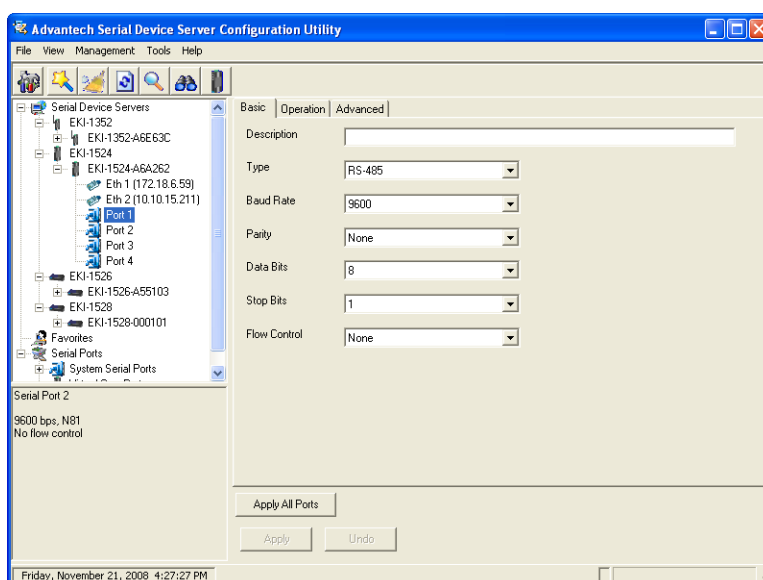

Select the device in this sub-tree. The first tab on the “Configuration Area” shows the summary of “Basic Information” included device type, version, and name, “Ethernet Information”, and “Serial Port Information”. In the serial port information frame, it displays the operation mode, status and connected host IP.

Click on the “+” before the device name, and the utility will expand the interfaces on this device server.

Click on each item, you will entry the configuration page to change the setting. The configuration will be introduced on following sections.

3.2.2 Clear Device List and Search Again

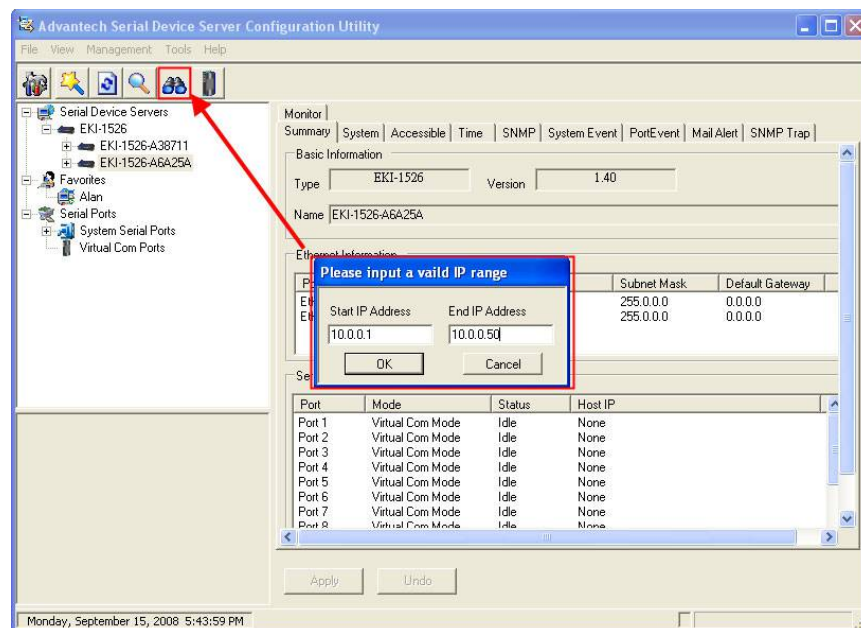

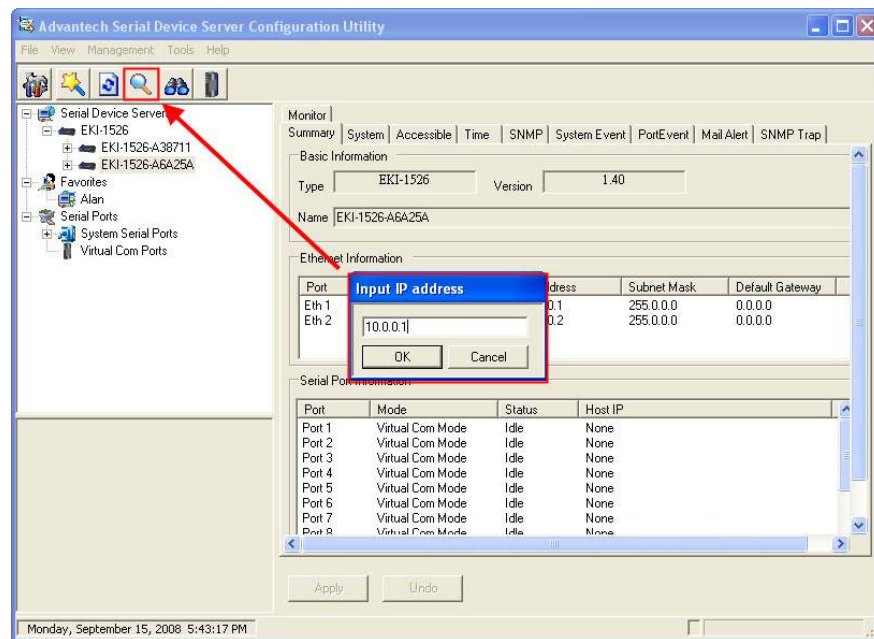

You can click the  button on the Quick Tool Bar. The utility will clear all list device servers in the Serial Device Server List Area and re-search again. Don't use this function frequently. The warning message will be pop-up when you double click this button.

You can click the  button on the "Quick Tool Bar". The utility will search serial device server on local LAN.

3.2.3 Manual Appending

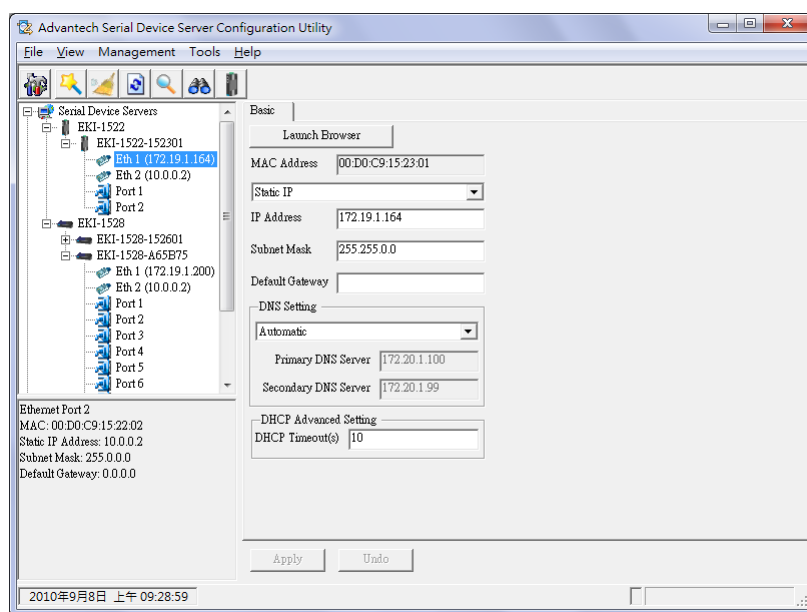

Using “Add IP address to Favorite” or “Search a Range of IP addresses” function, you are able to add one device or group of devices to “Favorites”. These devices can locate on local network domain or other network domain.

3.3 Network Settings

This section explains how to configure the EKI-152X series network using this utility so that it can communicate over a network with serial devices.

Click on the “+” before the model name (e.g. EKI-1524), and the utility will expand the tree structure to show the individual device name. And click on the “+” before the device name, and the utility will expand the interfaces on this device server. Select the Ethernet interface. (Select Eth1 or Eth2, these are two individual Ethernet ports)

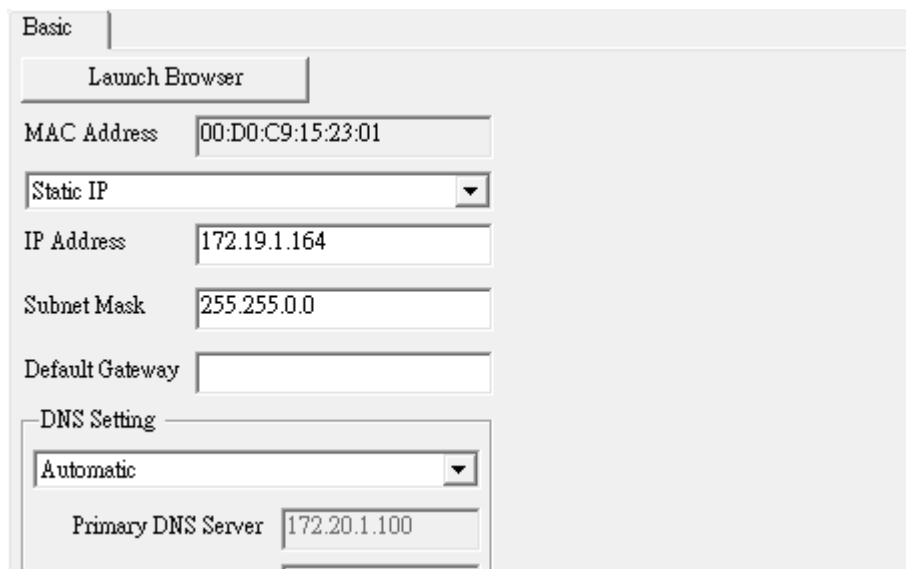

MAC address:

The MAC address is for the local system to identify and locate each serial device servers. This MAC address is already set before delivery from factory, hence no need for further configuration.

IP address, Subnet Mask, Default Gateway:

You can choose from four possible IP Configuration modes --- **Static**, **DHCP**, **BOOTP**, and **DHCP/BOOTP**.

Basic

Launch Browser

MAC Address 00:D0:C9:15:23:01

Static IP

IP Address 172.19.1.164

Subnet Mask 255.255.0.0

Default Gateway

DNS Setting

Automatic

Primary DNS Server 172.20.1.100

Static IP

User defined IP address, Subnet Mask, and Default Gateway.

DHCP + Auto-IP

DHCP Server assigned IP address, Subnet Mask, Default Gateway, and DNS.

BOOTP + Auto-IP

BOOTP Server assigned IP address.

DHCP + BOOTP + Auto-IP

DHCP Server assigned IP address, Subnet Mask, Default Gateway, and DNS, or BOOTP Server assigned IP address. (If the DHCP Server does not respond)

DNS Setting

In order to use DNS feature, you need to set the IP address of the DNS server to be able to access the host with the domain name. The EKI-152X series serial device server provides Primary DNS Server and Secondary DNS Server configuration items to set the IP address of the DNS server. Secondary DNS Server is included for use when Primary DNS server is unavailable.

DHCP Advanced Setting

When you enabling DHCP protocol to get IP address, it will be waited DHCP server to give IP within DHCP timeout. The default value is 180 seconds.

Note!

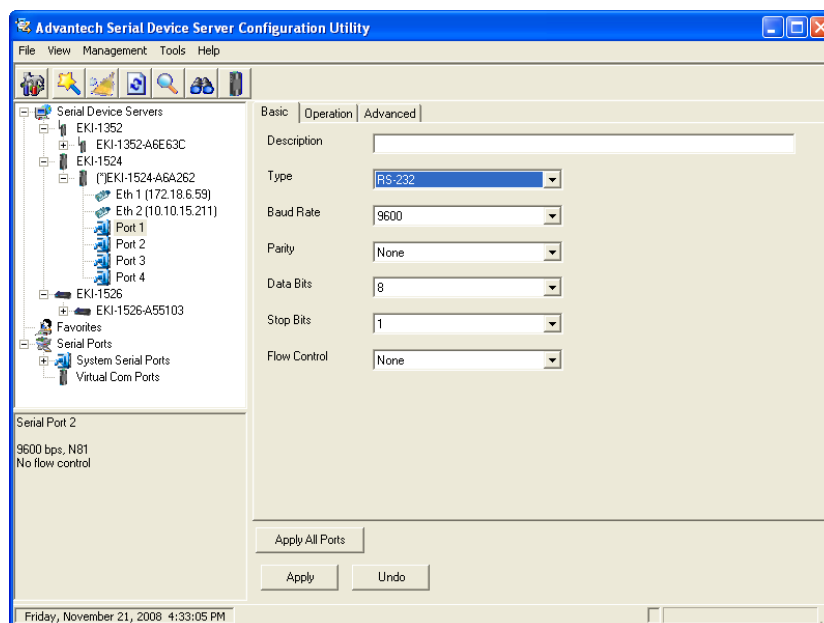

When you have finished the configuration of these settings for each category, please press the "Apply" button in order to make these settings effective on the Serial Device Server. (Will reboot your Serial Device Server immediately)

3.4 Serial Settings

This section explains how to configure the EKI-152X series serial communication parameters using this utility. There are various operation modes that are suitable for different application.

Click on the "+" before the model name (e.g. EKI-1524), and the utility will expand the tree structure to show the individual device name. And click on the "+" before the device name, and the utility will expand the interfaces on this device server. Select the serial interface.

■ Description:

You can give a more detailed description on the function of the port for easier management and maintenance. Descriptions have a limit of 128 characters.

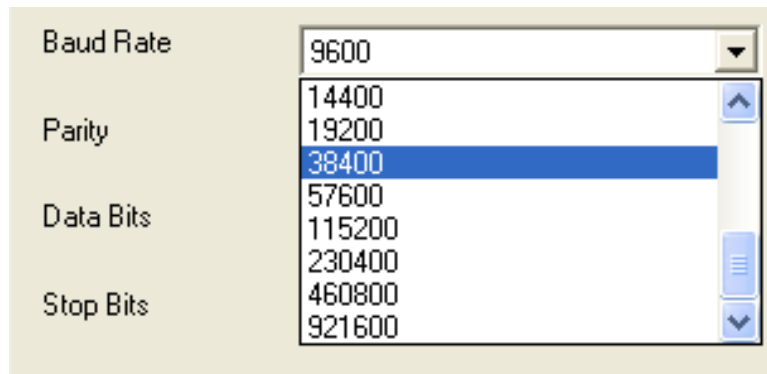

■ Type

The EKI-152X series serial device server offers three kinds of serial interfaces, RS-232, RS-485 and RS-422. User can use any of the three serial interfaces according to user's requirements.

■ **Baud Rate:**

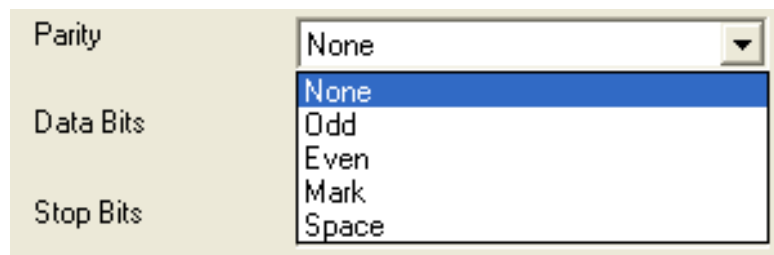

The EKI-152X series serial device server supports baud rate from 50 to 921.6Kbps. While setting the baud rate, please note that the value should conform to the current transmission speeds of connected devices.

Baud Rate	9600
Parity	None
Data Bits	8
Stop Bits	1
Flow Control	None

■ **Parity:**

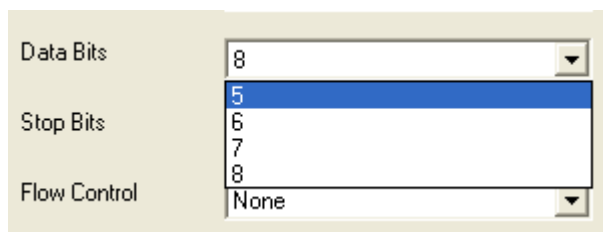

The EKI-152X series serial device server provides five options: None, Odd, Even, Space, and Mark.

Parity	None
Data Bits	8
Stop Bits	1
Flow Control	None

■ **Data Bits:**

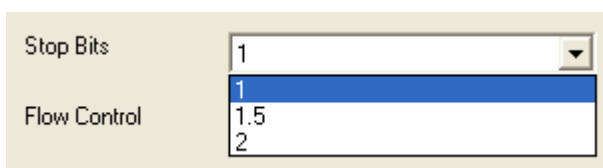

The EKI-152X series serial device server provides four options: 5, 6, 7 and 8.

Data Bits	8
Stop Bits	1
Flow Control	None

■ **Stop Bits:**

The EKI-152X series serial device server provides three options: 1, 1.5 and 2.

Stop Bits	1
Flow Control	None

■ Flow Control:

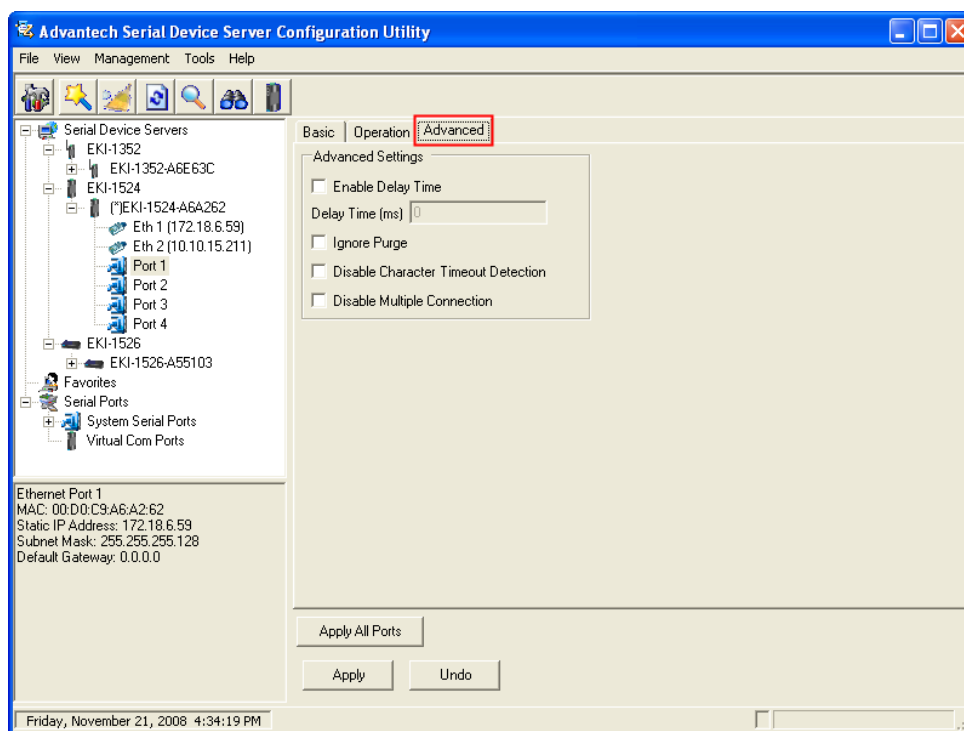

The EKI-152X series serial device server provides four options: None, XOn/XOff, RTS/CTS, and DTR/DSR.

Note! *When you have finished the configuration of these settings for each category, please press the “Apply” button in order to make these settings effective on the Serial Device Server. Or you can press “Apply All Ports” to make these setting effective for all serial ports on the Serial Device Server.*

■ Advanced Settings:

The EKI-152X series serial device server provides the advanced settings for some special applications which need critical time requirements. In normal applications, these settings are recommended not to be set to avoid the unusual action happened.

Delay Time (ms)

When you enable the delay time, the serial port will postpone the received data for the time interval you set, and then send the received data to the TCP/IP network.

Ignore Purge

Some application program will purge the serial port while it is the first time opens this serial port. You can ignore the purge command by enable this option.

Disable Character Timeout Detection

Enable this option will disable the serial port character timeout detection.

Disable Multiple Connection

Enable this option will disable the multi-access function, thus the only one TCP connection is allowed on this serial port.

Buffer Data Size

It determines the internal buffer size to queue data to become a packet.

Port Timeout

It determines the time period that received data from serial port will be postponed.

RTL (Receiver Trigger Level)

It determines how often or when the receiver interrupt will be triggered.

TTL (Transmitter Trigger Level)

It determines how often or when the transmitter will be triggered.

FCL (Flow Control Low Trigger Level)

It determines when the transmission will be suspend or resume.

Write to FIFO

It determines the maximum characters will be wrote into one interrupt.

RTS Status

DTR Status //¥÷ŪwP÷

RTS, DTR signals are initially high level after booting. It determines the status of RTS and DTR for following four options: ON, OFF, Toggle by connect, and Toggle by data.

Note! *These settings are just for some special application cases. We recommend do not enable the advanced settings in normal usage.*

3.5 Operation Mode Settings

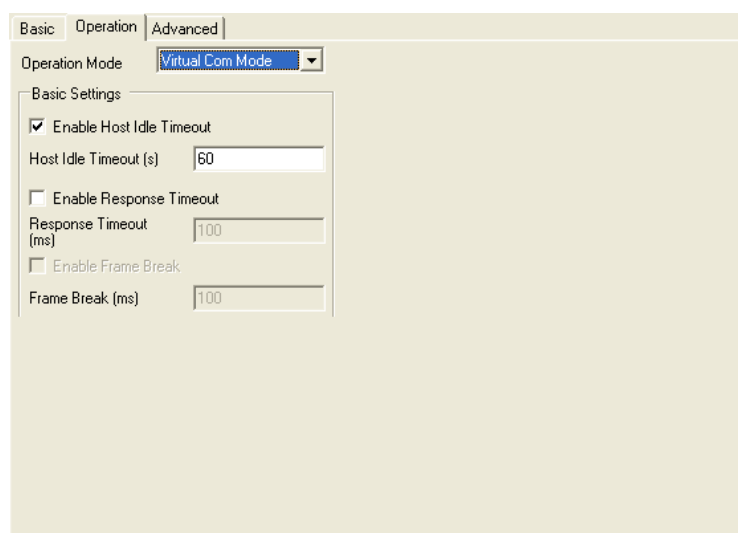

3.5.1 Virtual COM Mode

The EKI-152X series serial device server extends traditional COM ports of a PC to Ethernet access. Through Ethernet networking, users can control and monitor

remote serial devices and equipments over LAN or WAN. The EKI-152X series comes with a COM port redirector (Virtual COM driver) that transmits all serial signals intact. This means that your existing COM-based software can be preserved, without modifying to fulfill the needs. The Virtual COM mode allows user to continue using RS-232/422/485 serial communications software that was written for pure serial communication applications.

The EKI-152X series comes with COM port redirector (virtual COM driver) that work with Window 2000/XP/Vista(X86) systems. The driver establishes a transparent connection between host and serial device by mapping the IP of the EKI-152X seriesserial device server serial port to a local COM port on the host computer.

The EKI-152X series provides Multi-access function through Ethernet connection path. Allow the maximum of 5 connections to open one serial port simultaneously. In this mode, all connection has to use the same serial setting. If one serial setting of these connections is different from others, the data communication may operate incorrectly.

■ Host Idle Timeout

The "Host Idle Timeout" setting monitors the connection between the host and the device. If the "Host Idle Timeout" setting time is reached, the device server will release the resources allocated to the port mapping. This prevents a stalled host from affecting the connective device.

The EKI-152X series provides Multi-access function through Ethernet connection path. Allow the maximum of 5 connections to open one serial port simultaneously. In the mode, all connection has to use the same serial setting. If one serial setting of these connections is different from others, the data communication may operate incorrectly.

There are two operating mode of Multi-access function. One is **Normal mode**; another is **Round-Robin mode**.

■ Normal mode

Disabling "Response Timeout" parameter, the EKI-152X series will operate in "normal mode". When multiple hosts open the serial port simultaneously, the EKI-152X series only offers control ability for the first connected host and provides data communication function for others. Each serial port supports up to five simultaneous con-

nections, so multiple hosts can transmit/receive data to/from the same serial port simultaneously. Every host can transmit data to the same serial port, and the EKI-152X series will also transmit data to every hosts. When the multiple hosts transmit data to the same serial port at the same time, the received data from Ethernet and the outputs of serial port are mixed. When the EKI-152X series receives data from serial port, the data will also be transmitted to the connected hosts simultaneously.

■ **Round-Robin mode:**

Enabling “*Response Timeout*” parameter, the EKI-152X series will operate in “Round-Robin mode”. Each serial port supports up to five simultaneous connections, so multiple hosts can transmit/receive data to/from the same serial port simultaneously. Every host can transmit data to the same serial port simultaneously, but the EKI-152X series will process the data communication in order. The EKI-152X series will process the first host’s request and reply the response to the first host. The EKI-152X series serial device server can determine the end of the serial acknowledgement via response timeout. When EKI-152X series serial device server receives nothing from serial port after the setting of response timeout, the device will reply the acknowledgement to the host and then process the next host’s request. While the connected hosts are more and “Response Timeout” is long, the process time is much longer.

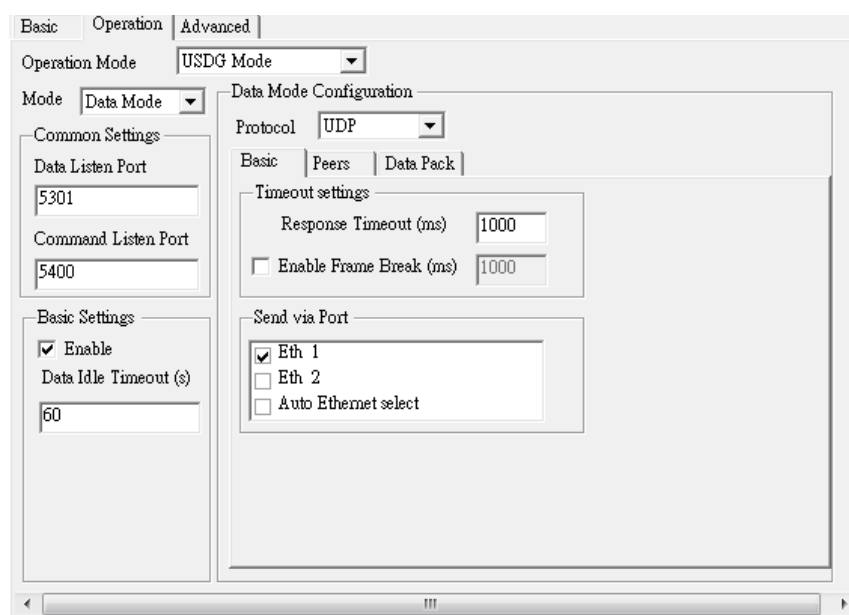

Frame Break is a very import parameter for Round Robin mode. This parameter is the smart way to reduce inefficient waiting time and the EKI-152X series can transmit data more efficiently. Disabling the Frame Break function, the EKI-152X series will wait “Response Timeout” period, whether the device have transmitted the data. During this period, the commands from hosts will be queued and the EKI-152X series just processes this command. Enabling “Frame Break”, if the serial port idle is longer than the “Frame Break” period, the EKI-152X series will assume the communication is completed and continue the next host’s query. This is an efficient way to reduce the waiting time and improve the performance.

3.5.2 Data Mode (USDG Mode)

The EKI-152X series can be Data server or Data client either. Both operations support TCP and UDP protocol. The EKI-152X series makes your serial devices behave just like networking devices. You can issue commands or transmit data from serial devices, which connected to the EKI-152X series, to any devices that are connected to the Internet.

The EKI-152X series allows most 5 host PCs accessing data simultaneously via polling networking architecture. You can use it according to your application. If you want to access the EKI-152X series, you must ascertain your application software supports standard networking application programming interface (API) such as: WinSock Socket.

You might select “USDG Mode” as the following figure to change the mode of the port to TCP server/client or UDP mode.

Protocol

The EKI-152X series provides TCP/IP and UDP two protocols. In settings, you can choose either TCP mode or UDP mode according to your application.

Data Listen Port

The TCP/UDP port number represents the source port number, and the number is used to identify the channel for remote initiating connections. Range: 1024-65533. If an unknown caller wants to connect to the system and asks for some services, they need to define the TCP/UDP port to carry a long-term conversation.

Each node on a TCP/IP network has an IP address, and each IP address can allow connections on one or more TCP port. The well known TCP ports are those that have been defined; for example, port 23 is used for Telnet connections. There are also custom sockets that users and developers define for their specific needs. The default TCP/UDP port of the EKI-152X series is 5300. The example initial 5300 is System Port, and 5301 is Data Port. But users can adjust them by one's preference or application.

Each port has its own data listen port to accept connected request of other network device. So, the data listen port can't be set the same value. You can transmit/receive data to/from device via the data listen port.

Command Listen Port

Each port has its own command listen port to accept connected request of other network device. So, the command listen port can't be set the same value. You can use 'AT command' to change the port setting via the command listen port. The Command Listen Port should be different from the Data Listen port.

Data Idle Timeout

The default is 60 seconds. If you want to keep connection continually, you can disable the Data Idle Timeout. Data idle Time is the time period in which the device waits for data. If the EKI-152X series does not receive data over an established idle

time, the EKI-152X series will disconnect temporarily. When the data comes to the EKI-152X series, it will reconnect automatically. Users do not need to reconnect.

Enable Time Sharing

The EKI-152X series provides Multi-access function through Ethernet connection path. Allow the maximum of 5 connections to open one serial port simultaneously. In the mode, all connection has to use the same serial setting. If one serial setting of these connections is different from others, the data communication may operate incorrectly.

There are two operating mode of Multi-access function. One is Normal mode; another is Round-Robin mode.

Normal Mode

Disabling “Response Timeout” parameter, the EKI-152X series will operate in “normal mode”. When multiple hosts open the serial port simultaneously, the EKI-152X series only offers control ability for the first connected host and provides data communication function for others. Each serial port supports up to five simultaneous connections, so multiple hosts can transmit/receive data to/from the same serial port simultaneously. Every host can transmit data to the same serial port, and the EKI-152X series will also transmit data to every hosts. When the multiple hosts transmit data to the same serial port at the same time, the received data from Ethernet and the outputs of serial port are mixed. When the EKI-152X series receives data from serial port, the data will also be transmitted to the connected hosts simultaneously.

Round-Robin Mode

Enabling “Response Timeout” parameter, the EKI-152X series will operate in “Round-Robin mode”. Each serial port supports up to five simultaneous connections, so multiple hosts can transmit/receive data to/from the same serial port simultaneously. Every host can transmit data to the same serial port simultaneously, but the EKI-152X series will process the data communication in order. The EKI-152X series will process the first host’s request and reply the response to the first host. The EKI-152X series serial device server can determine the end of the serial acknowledgement via response timeout. When EKI-152X series serial device server receives nothing from serial port after the setting of response timeout, the device will reply the acknowledgement to the host and then process the next host’s request. While the connected hosts are more and “Response Timeout” is long, the process time is much longer.

Frame Break is a very import parameter for Round Robin mode. This parameter is the smart way to reduce inefficient waiting time and the EKI-152X series can transmit data more efficiently. Disabling the Frame Break function, the EKI-152X series will wait “Response Timeout” period, whether the device have transmitted the data. During this period, the commands from hosts will be queued and the EKI-152X series just processes this command. Enabling “Frame Break”, if the serial port idle is longer than the “Frame Break” period, the EKI-152X series will assume the communication is completed and continue the next host’s query. This is an efficient way to reduce the waiting time and improve the performance.

Auto Connect Peer IP

If enabling this option, EKI-152X series will connect to TCP/IP which are set at Peers page automatically after boot up.

Peer Number

Set the number of network device which you want to connect. You can set maximum sixteen network devices which you want to connect. You need to fill out the IP Address and Port (including local port and peer port) of network devices which you want to connect.

The image shows the 'Data Mode Configuration' dialog box with the 'Peers' tab selected. At the top, the 'Protocol' is set to 'TCP'. Below the tabs, there is a section for 'Peers for Receiving Data (0/16)'. It includes input fields for 'Local Port', 'Peer IP', and 'Peer Port'. Below these fields is a table with three columns: 'Local Port', 'Peer IP', and 'Peer Port'. To the right of the table are 'Add' and 'Delete' buttons.

Data Pack

Data pack means you can set condition of receiving data from serial port to be a package according to your application. There are four options to set the data packing: by data size (Byte), by time interval (ms), by character timeout (4 Bytes), or by end of character.

The image shows the 'Data Mode Configuration' dialog box with the 'Data Pack' tab selected. The 'Protocol' is still 'TCP'. The 'Pack conditions' section has four checkboxes: 'Pack by size (Bytes)', 'Pack by interval (ms)', 'Pack by character timeout (4 Bytes)', and 'Pack by end-character'. Each checkbox has a corresponding input field with the value '0'. Below these is the 'End-Character' section, which has radio buttons for 'ASCII' and 'HEX' (selected), and an input field containing 'D8'. A note at the bottom states: 'Note: Pack sent immediately when reach 1024 Bytes.'

3.5.3 Control Mode (USDG Mode)

In controlling mode, the EKI-152X series presents a modem interface to the attached serial device: it accepts AT-style modem commands to connect / disconnect to other

networking device. If you want serial device running application program to connect/disconnect to different devices dynamically, you can use controlling mode.

The “Control mode” provides three kinds of modem AT-style commands. The serial devices can use these commands to control the EKI-152X series to connect/disconnect to remote networking device. Thus, intelligent serial devices such as standalone PLC will send /receive data to/from devices one by one via Ethernet.

Please refer to the **Data Mode (USDG Mode)** to setup the Data Listen Port, Command Listen Port, and Data Idle Timeout.

Hangup Character

The default character is “+”. After you have connected to another serial device via EKI-152X series, you may need to disconnect. Then you can use the command “+++” to disconnect. To do this leaves your keyboard idle (don't press any keys) for at least several seconds, then press “+” three times. You can set “Guard Time” to define the idle time. Be sure that you have to press “+” over the idle time.

Guard Time

The default value is 1000 ms.

Example: <Guard Time> + <Guard Time> + <Guard Time> +

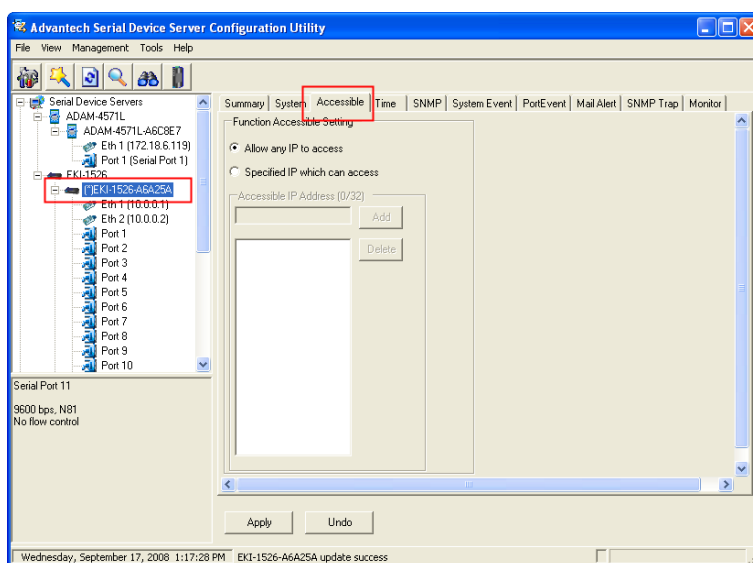

The following commands are available for EKI-152X series.

Table 3.1: AT Command List

Command	Function
ATDT<IP address> <TCP port> <CR>	“Forms a TCP connection to the specified host. Ex: ATDT 192.0.55.22:5201 In above example, the EKI serial device server forms a raw TCP connection to the networking device (192.0.55.22). The TCP port is 5301.”
ATA <CR>	Answering an incoming call
+++<CR>	Returns the user to the command prompt when entered from the serial port during a remote host connection.
<LF><CR> OK <LF><CR>	Commands are executed correctly
<LF><CR> CONNECT <LF><CR>	Connect to other device

<LF><CR> RING ddd.ddd.ddd <LF><CR>	Detect the connection request from other device, which IP address is ddd.ddd.ddd.ddd.
<LF><CR> DISCONNECT <LF><CR>	Disconnect from other device
<LF><CR> ERROR <LF><CR>	Incorrect commands
<LF><CR> FAIL <LF><CR>	If you issu an ATDT command and can not connect to the device, it will response “FAIL”.

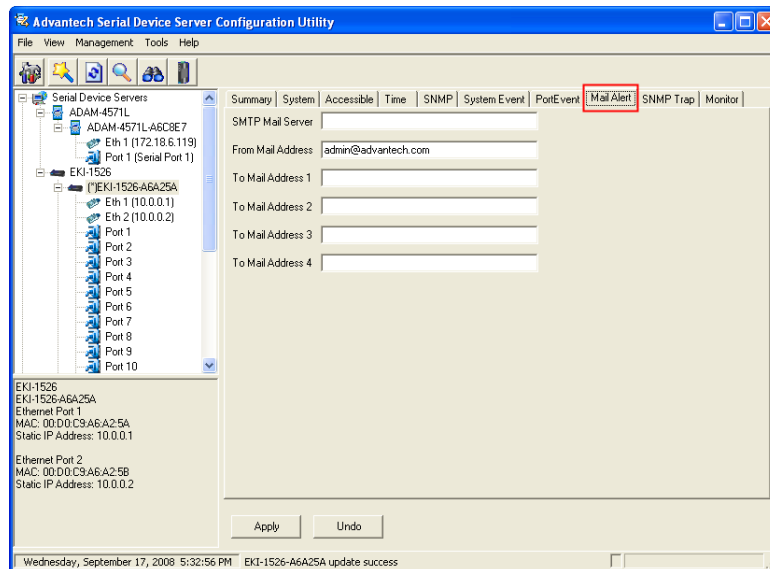

3.6 Accessible IP Settings

Accessible IP setting allows you to add or remove the blocking host IP addresses to prevent unauthorized access. If you want to restrict access to certain PCs, you can list their IP addresses in this area. The maximum is 32 PCs.

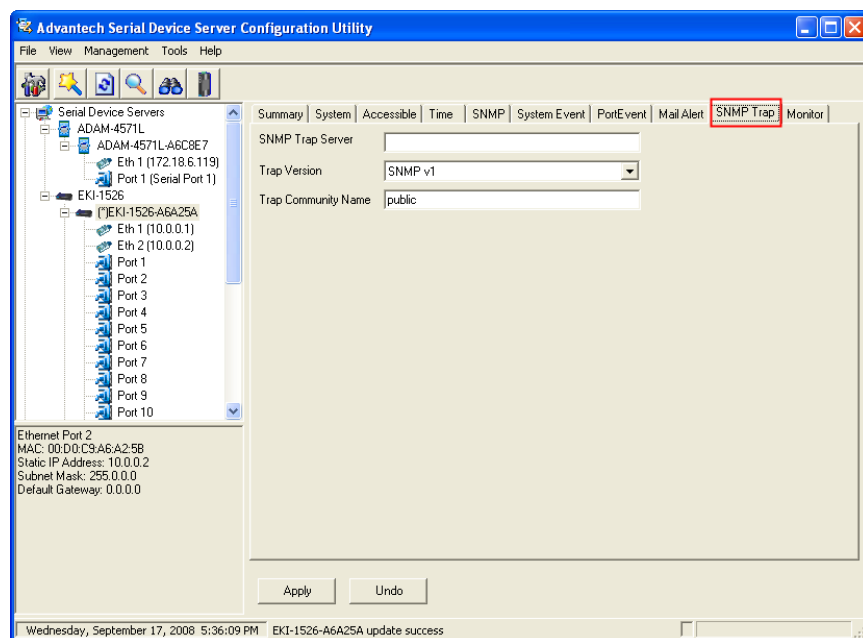

3.7 Auto Warning Settings

3.7.1 Email Alert

Consult your ISP or Network Administrator for the proper SMTP mail server settings. The auto warning functions may not work properly without proper settings.

3.7.2 SNMP Trap

You need to set the proper IP address of SNMP Trap Server. And choose the Trap Version; there are "SNMP v1" and "SNMP v2c" options.

3.7.3 System Event

Event	Mail Alert	Trap
Cold Start	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Warm Start	<input type="checkbox"/>	<input type="checkbox"/>
Authentication Fail	<input type="checkbox"/>	<input type="checkbox"/>
IP Change	<input type="checkbox"/>	<input type="checkbox"/>
Password Change	<input type="checkbox"/>	<input type="checkbox"/>
Ethernet 1 Down	<input type="checkbox"/>	<input type="checkbox"/>
Ethernet 2 Down	<input type="checkbox"/>	<input type="checkbox"/>

Cold Start

This refers to starting the system from power off. When performing a cold start, the EKI-152X series will send an e-mail, or send a SNMP trap after success rebooting.

Warm Start

This refers to restarting the system without turning the power off. When performing a warm start, the EKI-152X series will send an e-mail, or send a SNMP trap after restarting the system.

Authentication failure

The user types a wrong password from Console or Administrator. When authentication failure

Occurs, the EKI-152X series will send an e-mail, or send a SNMP trap.

IP Change

The user changes the EKI-152X series's IP address. When the IP address changes, the EKI-152X series will send an e-mail, or send a SNMP trap after restarting the system.

Password Change

The user changes the EKI-152X series's password. When the password changes, the EKI-152X series will send an e-mail, or send a SNMP trap after restarting the system.

Ethernet 1 Down

The Ethernet 1 port has link failure condition. When the Ethernet 1 links fail, the EKI-152X series will send an e-mail, or send a SNMP trap immediately.

Ethernet 2 Down

The Ethernet 2 port has link failure condition. When the Ethernet 2 links fail, the EKI-152X series will send an e-mail, or send a SNMP trap immediately.

3.7.4 Serial Port Event

Port	DCD Change Mail Alert	DCD Change Trap	DSR Change Mail Alert	DSR Change Trap
Port 1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 4	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 5	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 6	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 7	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 8	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 9	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 10	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 11	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 12	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 13	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port 14	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Check Selected Uncheck Selected

DCD Change

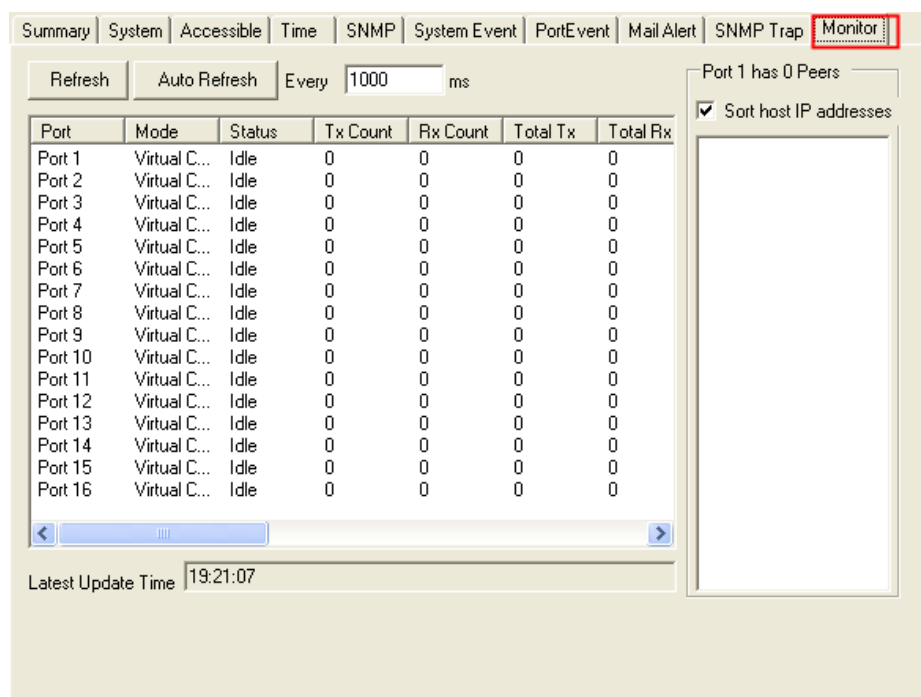

The DCD (Data Carrier Detect) signal has changed, also indicating that the modem connection status has changed. For example, a DCD change to high also means “Connected” between local modem and remote modem. If the DCD signal changes to low, it also means that the connection line is down. When the DCD signal changes, the EKI-152X series will send an e-mail, or send a SNMP trap.

DSR Change

The DSR (Data Set Ready) signal has changed, also indicating that the data communication equipment’s power is off. For example, a DSR change to high also means that the DCE is powered ON. If the DSR signal changes to low, it also means that the DCE is powered off. When the DSR signal changes, the EKI-152X series will send an e-mail, or send a SNMP trap.

3.8 Port Monitor

Configuration utility provides an excellent function that allows monitoring the serial ports’ status. It will present each serial port’s operation mode and status. The IP address of the host PC which is communicating with serial port will be list on the right window. Click “Refresh” button, the status will be refresh once. It will be auto refresh after click “Auto Refresh” and the time duration is depending on the setting (the default value is 1000ms).

3.9 Administrator Settings

The configuration utility provides several administrator settings for easy management and configuration. Right click the mouse on the device name in the sub-tree of Serial Device Sever List Area, and select these administrator settings.

EKI-1526-A6A25A
Import Device Setting Export Device Setting
Import Serial Port Setting Export Serial Port Setting
Refresh Data Locate
Lock Device
Restore to Factory Default Settings Reset Device
Add to Favorite
Auto Mapping Manual Mapping Update Firmware

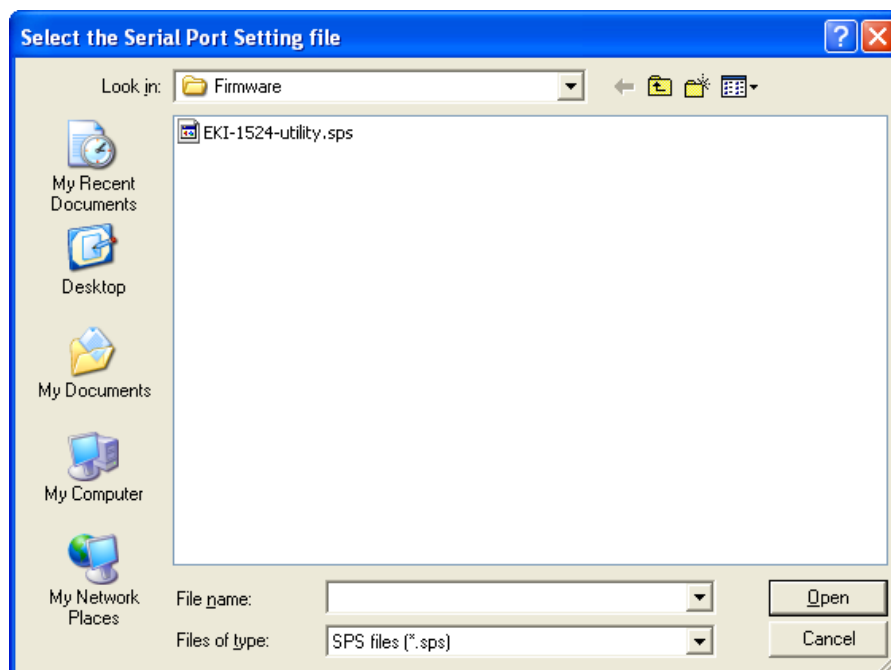

3.9.1 Import/Export Device Setting

The utility allows importing or exporting the serial device server's setting via the ".conf" file format.

3.9.2 Import/Export Serial Port Setting

The utility allows importing or exporting the serial port setting including "Basic Setting" and "Operation Setting" via ".sps" file format.

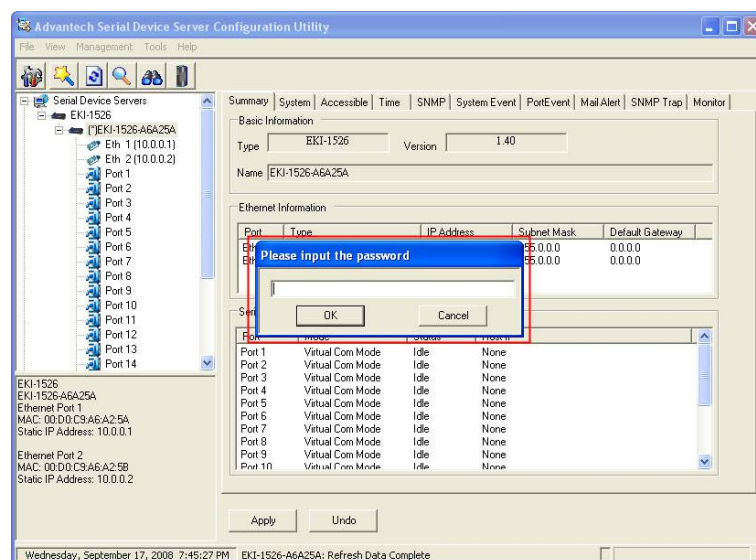

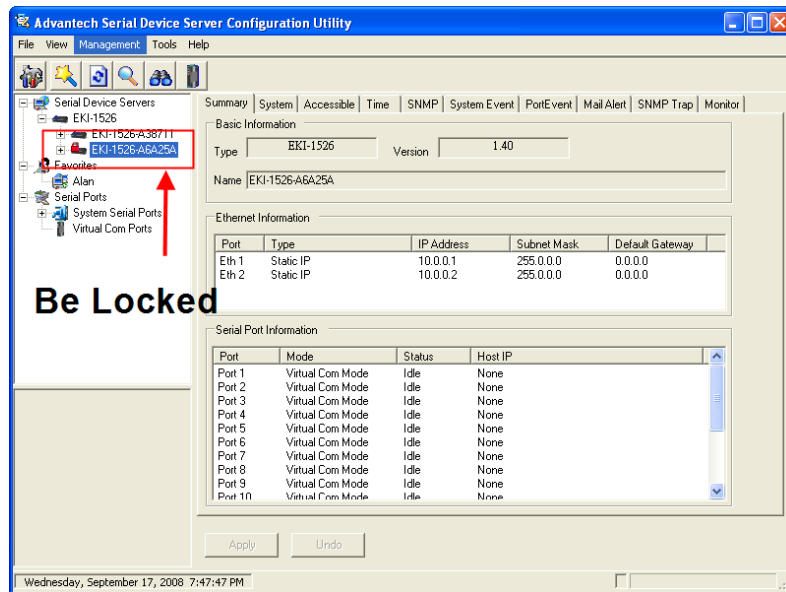

3.9.3 Locate the Serial Device Server

If there are many serial device servers need your management, you may need to identify which unit is correct to configuration on utility. Click “Locate” to make that unit’s “Status” LED be steady on and the buzzer will make the beep sound until you click “Stop Locate”.

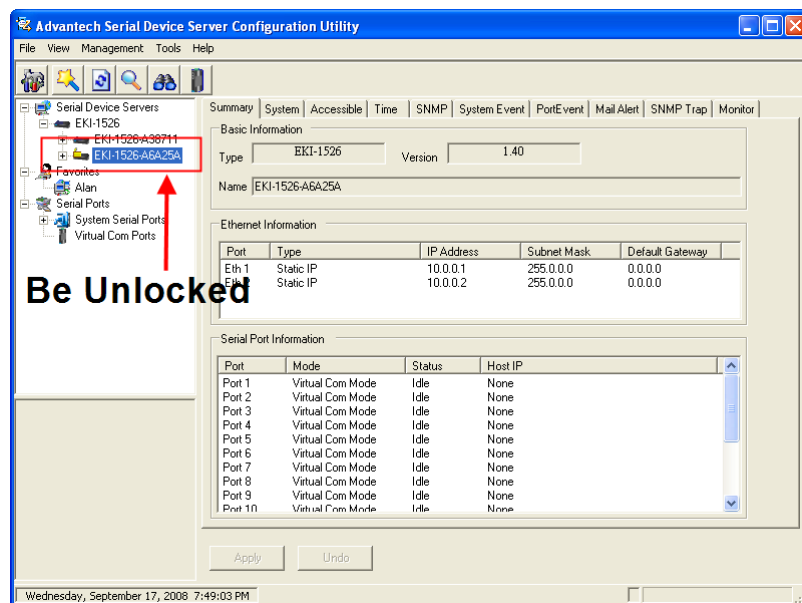

3.9.4 Lock the Serial Device Server (Password Protection)

The configuration utility provides the “Lock Device” function to make it more confidential. You need to set up a password while the first time clicking “Lock Device”. Be sure to click “Reset Device” to restart the serial device server and store your setting password into the memory.

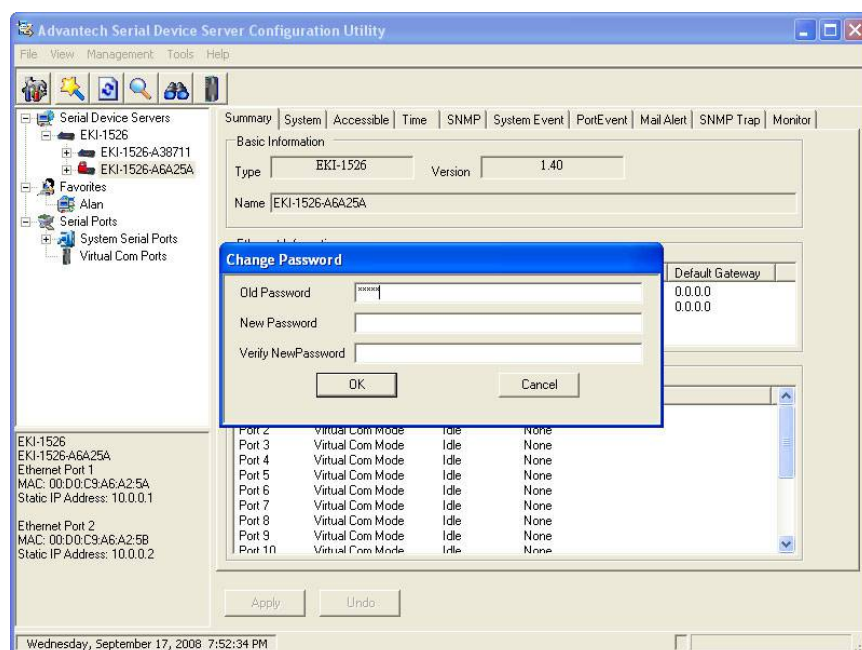

Click “Unlock Device” to unlock the serial device sever, and you need to fill in the password you have set up before. If you forgot the password, the only way to solve this problem is to restore the setting of the serial device server to the factory default which will be introduced next section.

If you want to disable this function or change the password, click “Change Password” to change the password to default “None” (leave the new password and confirm new password columns blank) to disable this function or other password you want to change. Be sure to click “Reset Device” to restart the serial device sever and store the new password into the memory.

3.9.5 Restore to Factory Default Settings

The configuration utility provides this function to let you can restore the serial device server to factory default settings. The confirm message will be pop-up while clicking “Restore to Factory Default Settings”. If you really want to restore the serial device sever to factory default settings, please click “Yes” button to continue.

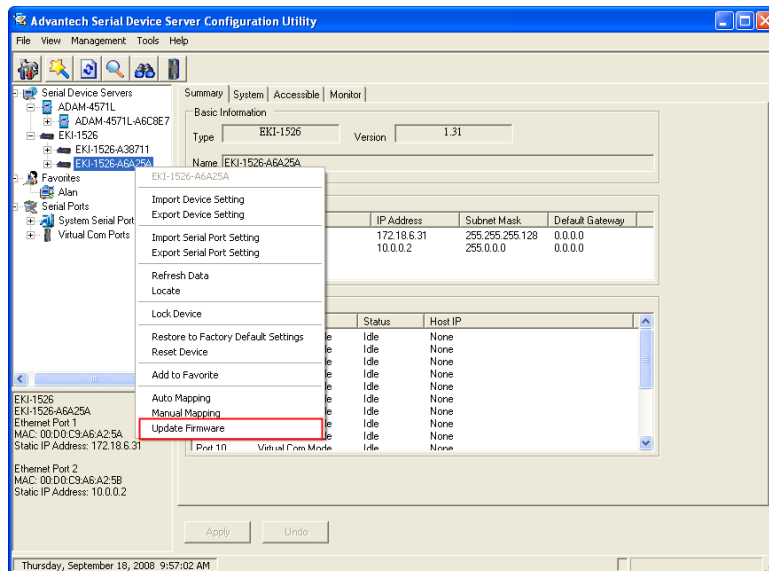

Then, please power off the serial device server within ten seconds, after reconnecting the power back, the all setting will be reset to the factory default. If the power remains more than ten seconds, the serial device server will not have any changes.

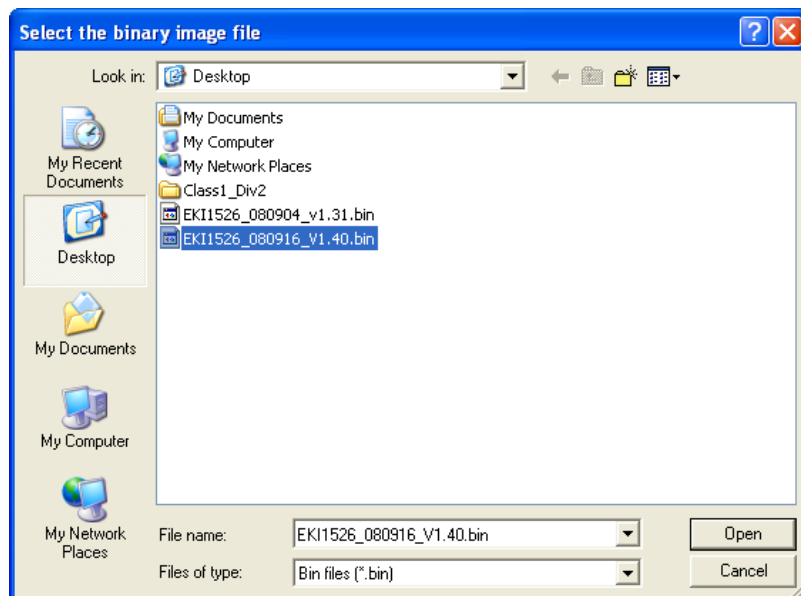

3.9.6 Update Firmware

Advantech continually upgrades its firmware to keep up with the ever-expanding world of computing. You can use the update firmware function in the utility to carry out the upgrade procedure. Please access Advantech's website: <http://www.advantech.com> to download the latest version of the firmware. Before update the firmware, make sure that your host's Network domain is as same as the serial device server or the host can establish the TCP connection to the serial device server.

Right Click on the device name and select "Update Firmware" function.

Select the firmware file you want to update.

Wait for few seconds to process the updating firmware. After downloading the firmware completely, click on the “OK” button. The serial device server will restart automatically.

Note! *Be sure that the host PC Ethernet network domain is as same as the EKI-152X series serial device server or the host PC can establish the TCP connection with the serial device server while doing the updating firmware process.*

Chapter 4

Setting COM
Redirector

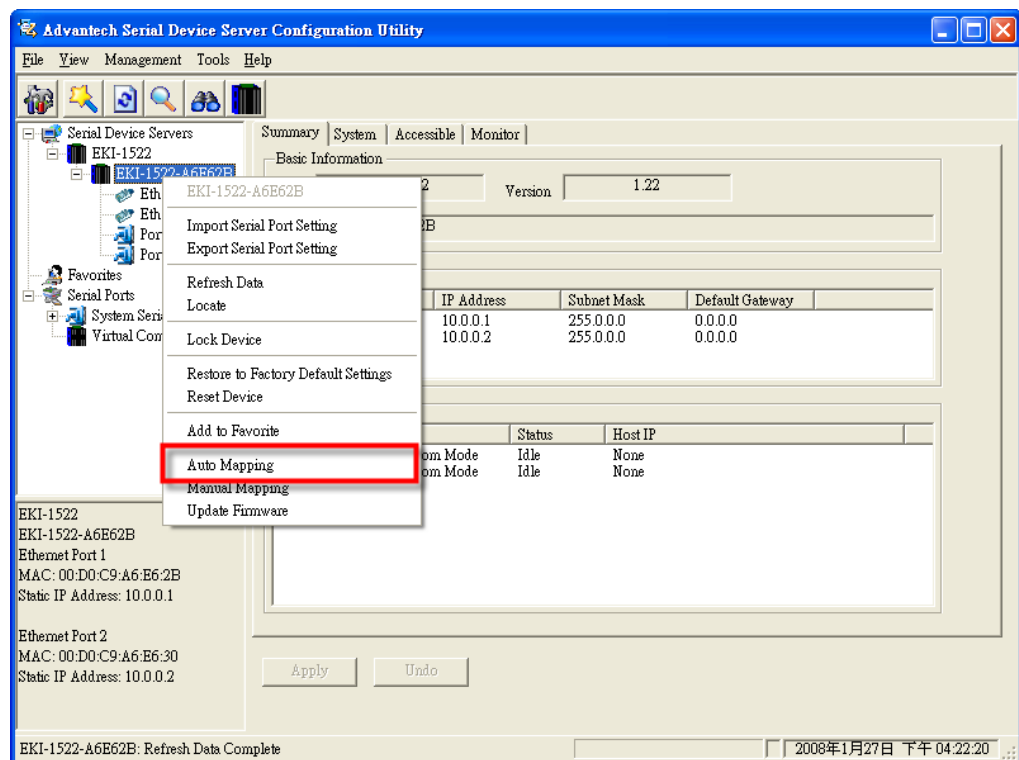

4.1 Setting COM Redirector (Virtual COM port)

Advantech COM port mapping software is a serial COM port redirector that creates virtual COM ports and provides access to serial devices connected to Advantech serial device servers. Your serial device applications can communicate with serial devices connected to Advantech serial device servers without software changes. Since the virtual COM ports work like standard Windows COM ports, your application software sees no difference between a local serial device and one connected to a Advantech serial device server.

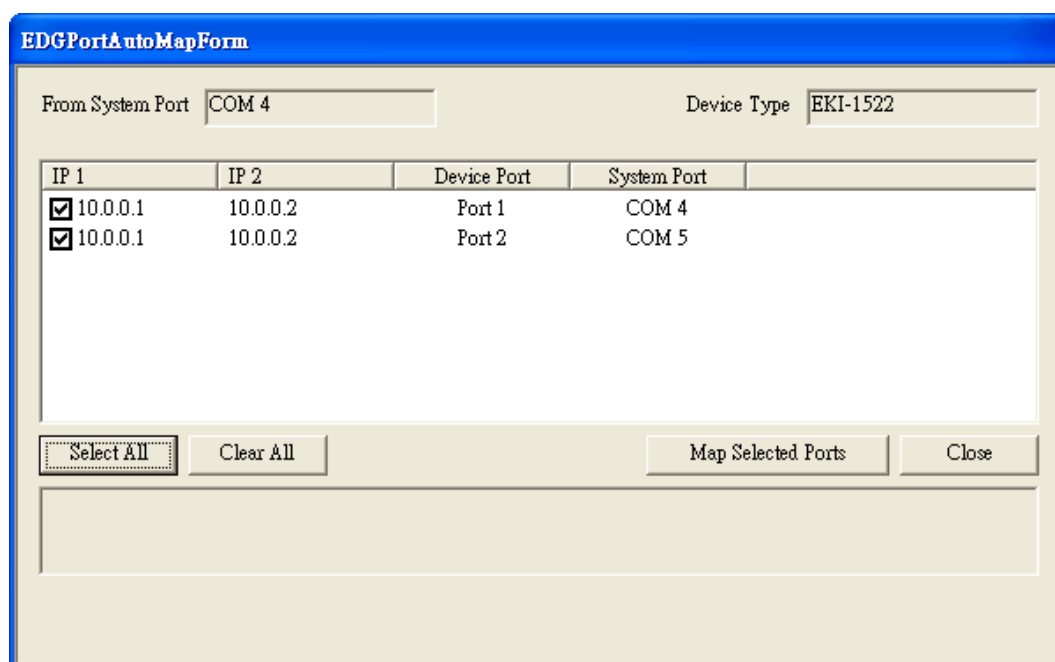

COM redirector utility and Virtual COM port Management utility are integrated into one utility with same GUI. Advantech Serial Device Server Configuration Utility can create all Virtual COM ports using “Auto Mapping” function. You can map the Virtual COM port by yourself.

4.1.1 Auto Mapping

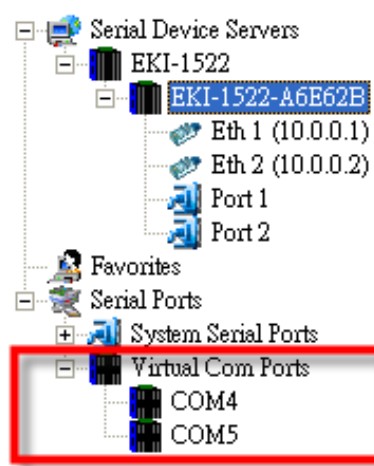

Right click the serial device name on the sub-tree of Device Server List area and select the “Auto Mapping” function.

The serial ports that can be assigned to virtual COM will be shown in this window. Select the serial ports you wish to map or click the <Select All> button and press <Map Selected Ports> button. The selected serial ports will be mapped to virtual COM ports in sequential order.

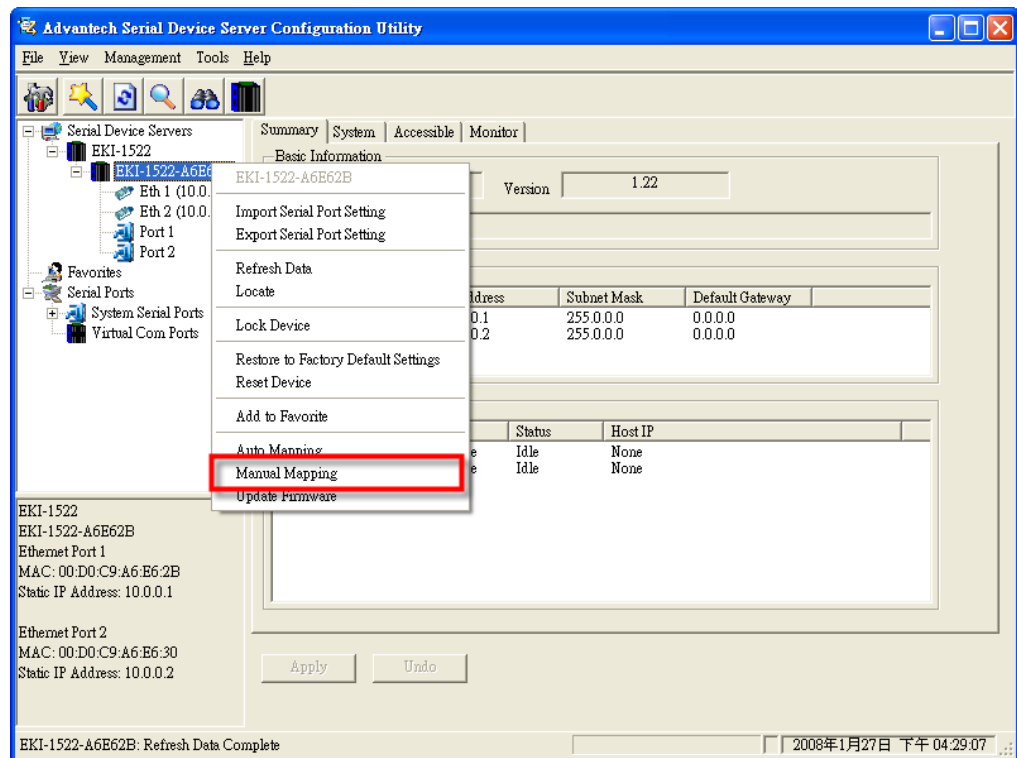

The COM ports in the “Virtual Com Ports” listing are now available for use by Windows applications.

4.1.2 Manual Mapping

Right click the serial device name on the sub-tree of Device Server List area and select the “Manual Mapping” function.

ADAM series, EDG series, and EKI wireless series have only one IP address. Select the serial port on the device server and the host COM that you want to set. Press <Map it> to establish the virtual COM port on the host.

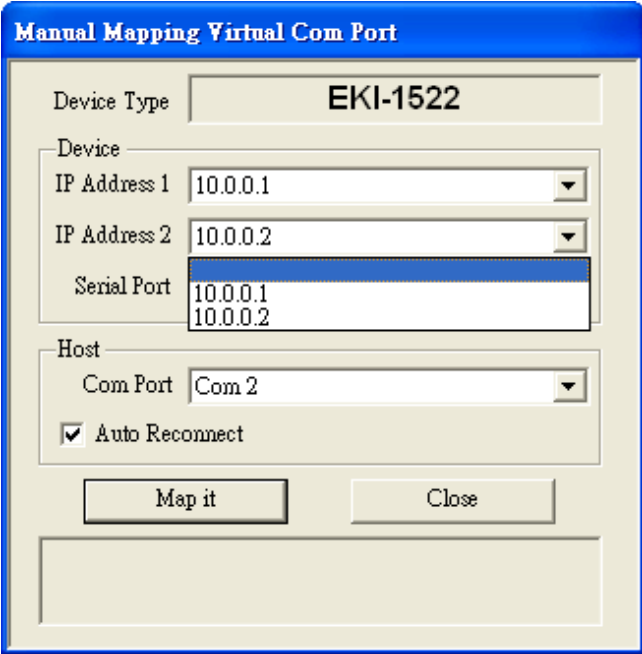

Auto Reconnect Property

Sometimes, the connection between Advantech serial device server and HOST is interrupted by network traffic or powered-off by accident. In such a situation, the host has to reconnect to Advantech serial device server. The function "Auto Reconnect" is for this purpose, if the Advantech serial server loses the connection to its host, the COM redirector will try to re-establish the connection while the host's AP access the virtual COM port. The COM redirector DOES NOT re-establish the connection automatically. When the connection is working again, the host's commands will be automatically received by the Advantech serial device server again. Reconfiguration is not necessary, so this function enhances the reliability of the system.

If the function is disabled, the connection can not be re-established again unless the COM redirector or host is restarted.

EKI-152X series has two Ethernet ports. You can select two Ethernet port to establish two Ethernet connections with one virtual COM port. It means that COM redirector will use one connection with the COM port on device server to communicate. If this connection failed, COM redirector will establish another Ethernet connection to communicate with device. The switch time will be 3 seconds ~ 5 seconds depending on the network traffic and host status.

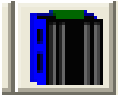

The image shows a Windows-style dialog box titled "Manual Mapping Virtual Com Port". It contains the following fields and controls:

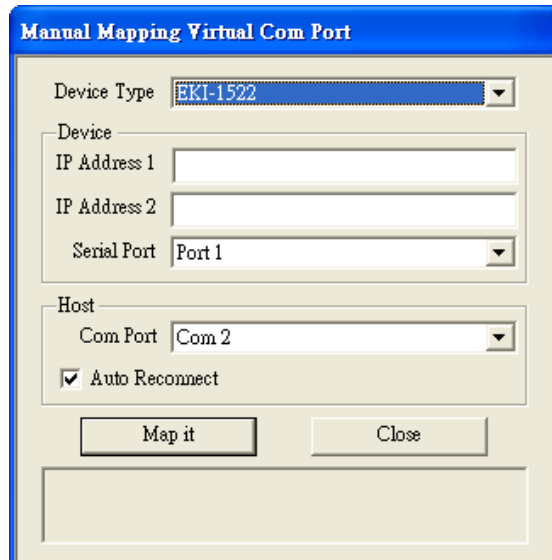

- Device Type:** A text box containing "EKI-1522".
- Device:** A section containing:
 - IP Address 1:** A dropdown menu showing "10.0.0.1".
 - IP Address 2:** A dropdown menu showing "10.0.0.2".
 - Serial Port:** A list box containing "10.0.0.1" and "10.0.0.2", with "10.0.0.1" selected.
- Host:** A section containing:
 - Com Port:** A dropdown menu showing "Com 2".
 - Auto Reconnect:** A checked checkbox.
- Buttons:** "Map it" and "Close" buttons at the bottom.

If you don't use the redundant function, just select the correct IP address in the IP address 1 field.

Note If you set the wrong IP address, COM redirector will still try to connect the device. It might cause the system performance low or other issue.

4.1.3 Manual Direct Mapping Virtual COM Port

Click the  button on the Quick Took area, you can add a target by selecting the Device Type and inputting the IP address without physically connecting the serial device server to the network.

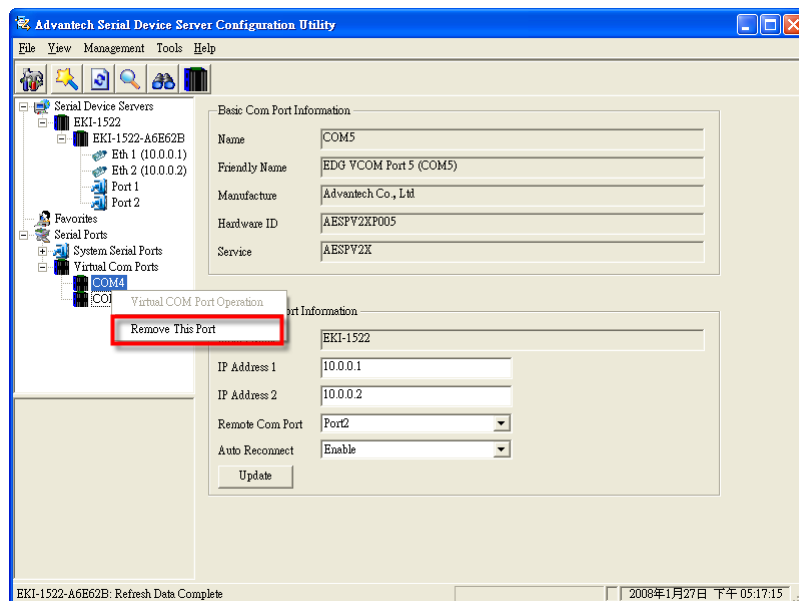

The dialog box titled "Manual Mapping Virtual Com Port" contains the following fields and controls:

- Device Type:** A dropdown menu with "EKI-1522" selected.
- Device:** A section containing:
 - IP Address 1:** An empty text input field.
 - IP Address 2:** An empty text input field.
 - Serial Port:** A dropdown menu with "Port 1" selected.
- Host:** A section containing:
 - Com Port:** A dropdown menu with "Com 2" selected.
 - Auto Reconnect:** A checked checkbox.
- Buttons:** "Map it" and "Close".

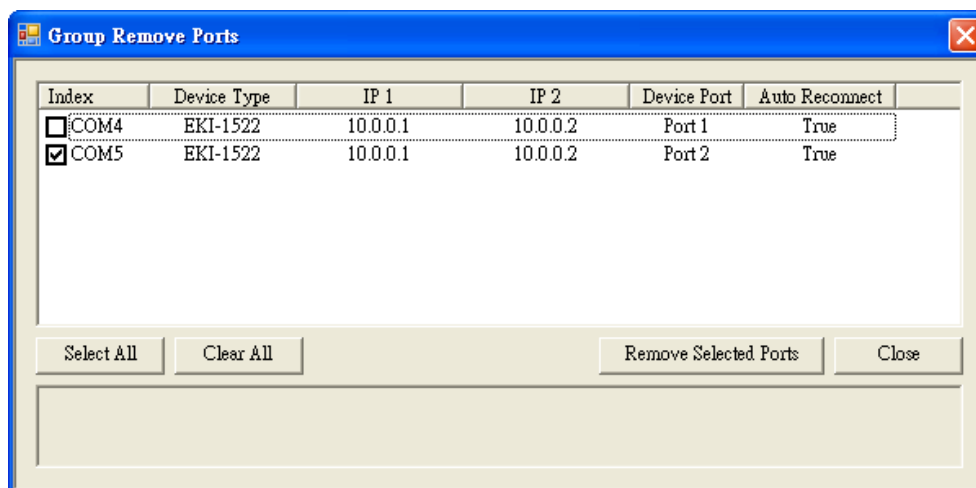

4.1.4 Remove the Virtual COM Port

If you want to remove the virtual COM port, you can remove them one by one or group remove ports.

- **Individually Remove**
Right click on COM port you have mapped and select "Remove This Port".

- **Group Remove Port**
Right click on Virtual Com Ports on Device Server List Area and select "Group Remove Port", you can choose which ports you want to remove.

4.2 Running Diagnostic Test

The purpose of this test is to make sure the communication from host PC to EKI-152X series is OK. If there is still an error, you can check the communication from the EKI-152X series to the devices.

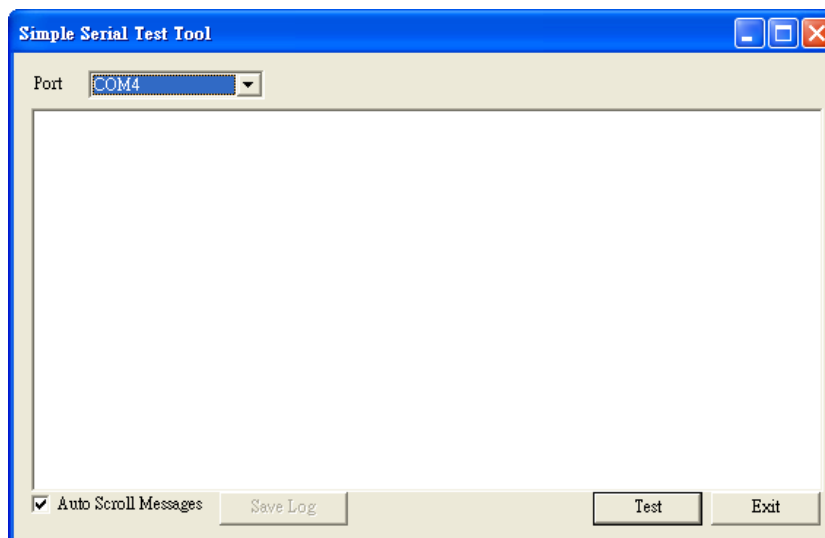

If the test is selected, an external test will be done to check that the connection signals for each port are working properly. **For the test, you will need to connect each port to a loopback tester (provided in the package). The loopback test only applies to RS-232 mode.** The test is divided into two parts: Signal test and Communication Parameters test.

Note Before you do this diagnostic test, you must complete the process of virtual COM port mapping.

1. Click "Simple Serial Test" on the Tools menu.

2. Select which COM port you want to run a diagnostic test, and then press “Test” button to process the testing.

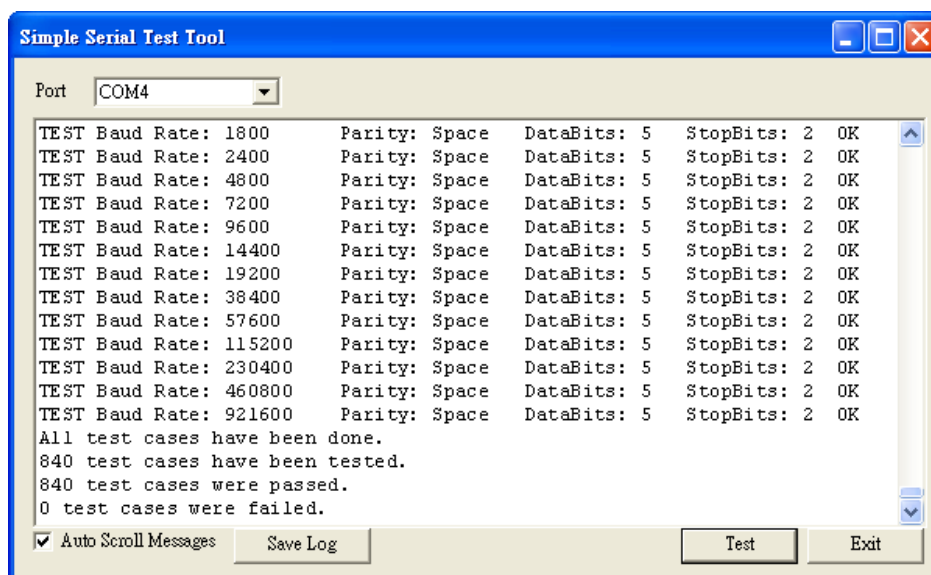

Signal Test

- RTS -> CTS check the RTS and CTS signal between two ports
- DTR -> RI check the DTR and RI signal between two ports
- DTR -> DSR check the DTR and DSR signal between two ports
- DTR -> DCD check the DTR and DCD signal between two ports

Communication Parameters Test

- Baud rate 50bps ~ 921.6kbps
- Data bit 5, 6, 7, 8
- Stop bit 1, 1.5, 2
- Parity Odd, Even, None, Space, Mark

When the test is finish, it will show the test result, the click “Exit” button to return to the utility window.

Chapter 5

Web-Based Configuration

5.1 Overview

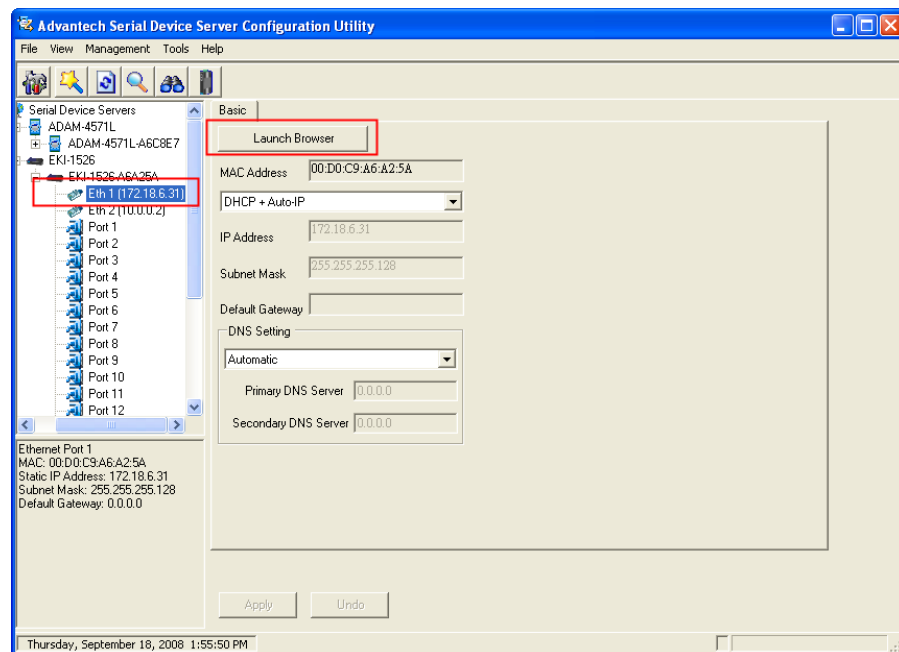

EKI-152X series serial device server can be configured through a web interface. By using a standard web browser, the same procedure as with the Windows configuration utility can be used. In the browser's address field, enter the IP Address of your EKI-152X series serial device server. The default IP setting is 10.0.0.1, but you should use the IP which you have previously assigned for this device. Once the IP is entered, you will be presented with the following windows.

Note! Before using the web-based configuration, make sure your host PC Ethernet network IP domain is as same as the serial device server, or it can establish the TCP connection with the serial device server.

5.2 Accessing the Web Page

By configuration utility

By Windows Internet Explorer

5.3 System

You can change the Device Name and Device Description on this page. You can also enable or disable the Web, Telnet, and SNMP functions. Moreover, you can set the Timezone related setting.

The screenshot shows the 'System Configuration' page of the ADVANTECH eAutomation web interface. The browser window is titled 'EKI-1526 Web Server - Windows Internet Explorer' and the address bar shows 'http://172.18.6.31/'. The left sidebar contains a navigation menu with 'Home', 'System' (highlighted with a red box), 'Net Configuration', 'Port Configuration', 'Monitor', 'Alarm', 'Change Password', 'Export', 'Import', and 'Reboot'. The main content area is titled 'System Configuration' and contains the following fields:

- Firmware version: 1.40
- Device Name: [Text input field]
- Device Description: [Text area]
- Web: ☐ Disable ☒ Enable
- Telnet: ☐ Disable ☒ Enable
- SNMP: ☐ Disable ☒ Enable
- Time Zone: (GMT+08:00)Taipei
- Local Time: 2008 / 9 / 18 15 : 6 : 33 [Modify]
- Daylight Saving: ☒ Disable ☐ Enable
- Begin Time: [] / [] Date(MM/DD)
- End Time: [] / [] Date(MM/DD)
- Time Server: [Text input field]

A 'Save' button is located at the bottom of the configuration area.

5.4 Network Configuration

Click the Net Configuration and chose either Net 1 or Net 2, there are Net Mode, IP Address, Subnet Mask, Default Gateway and DNS. Enter the corresponding values for your network environment. Remember press "Save" after fill in all values.

The screenshot shows the 'Net 1 Configuration' page of the ADVANTECH eAutomation web interface. The left sidebar is the same as in the previous screenshot, but 'Net 1' is selected under 'Net Configuration'. The main content area is titled 'Net 1 Configuration' and contains the following fields:

- Net Mode: DHCP/AutoIP
- MAC Address: 00-D0-C9-A6-A2-5A
- IP Address: 172.18.6.31
- Subnet Mask: 255.255.255.128
- Default Gateway: [Text input field]
- DNS: ☒ Automatic ☐ Specific
- DNS 1: [Text input field]
- DNS 2: [Text input field]

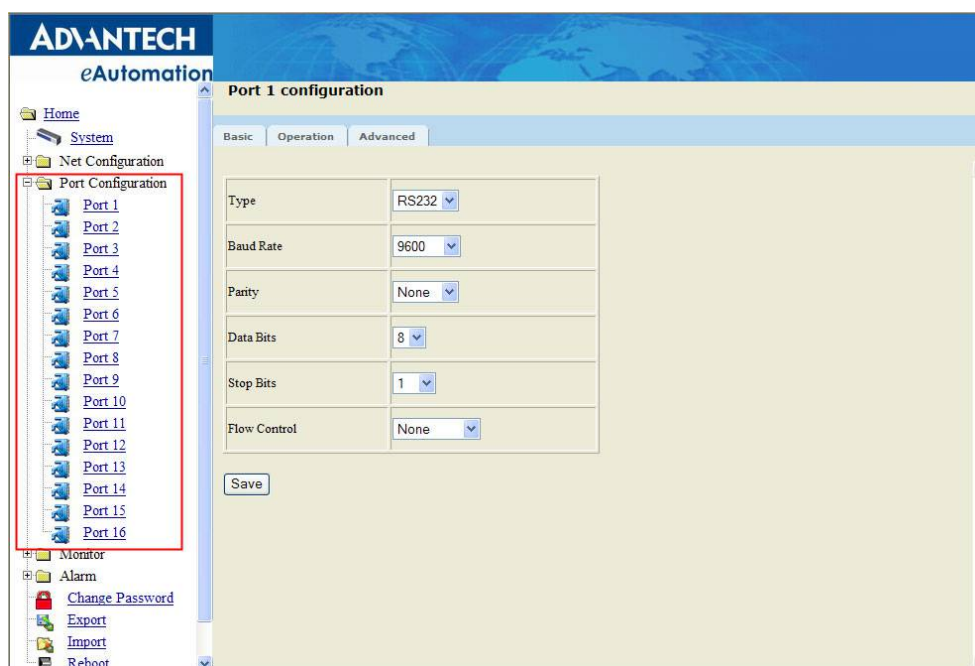

A 'Save' button is located at the bottom of the configuration area, highlighted with a red box.

Note! All new configurations will take effect after rebooting. The reboot function is located on the main menu of the Web Configuration.

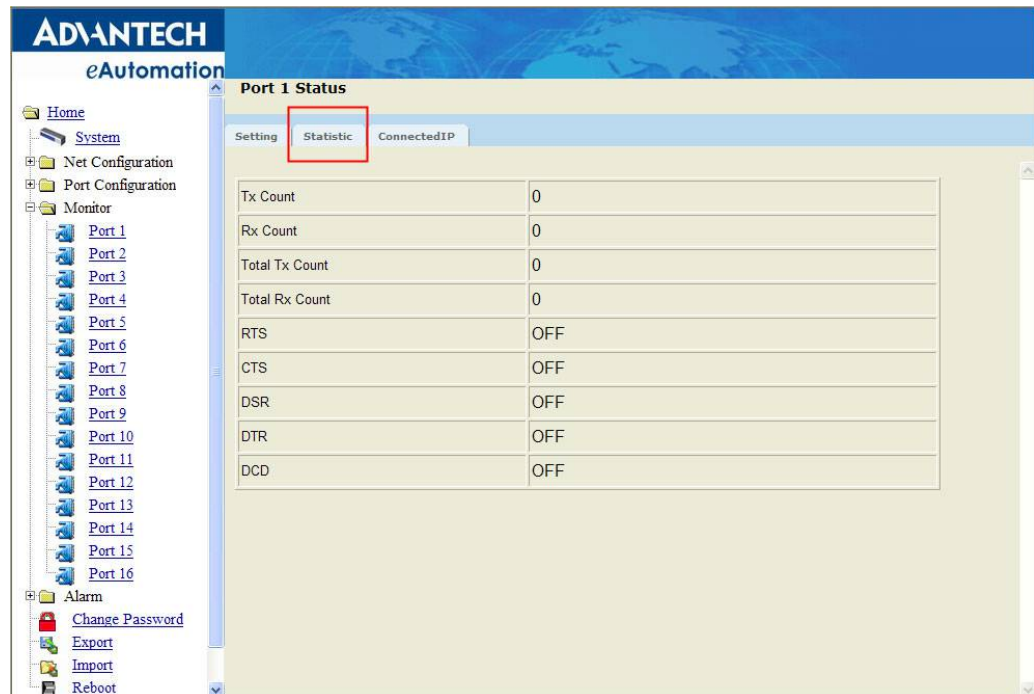

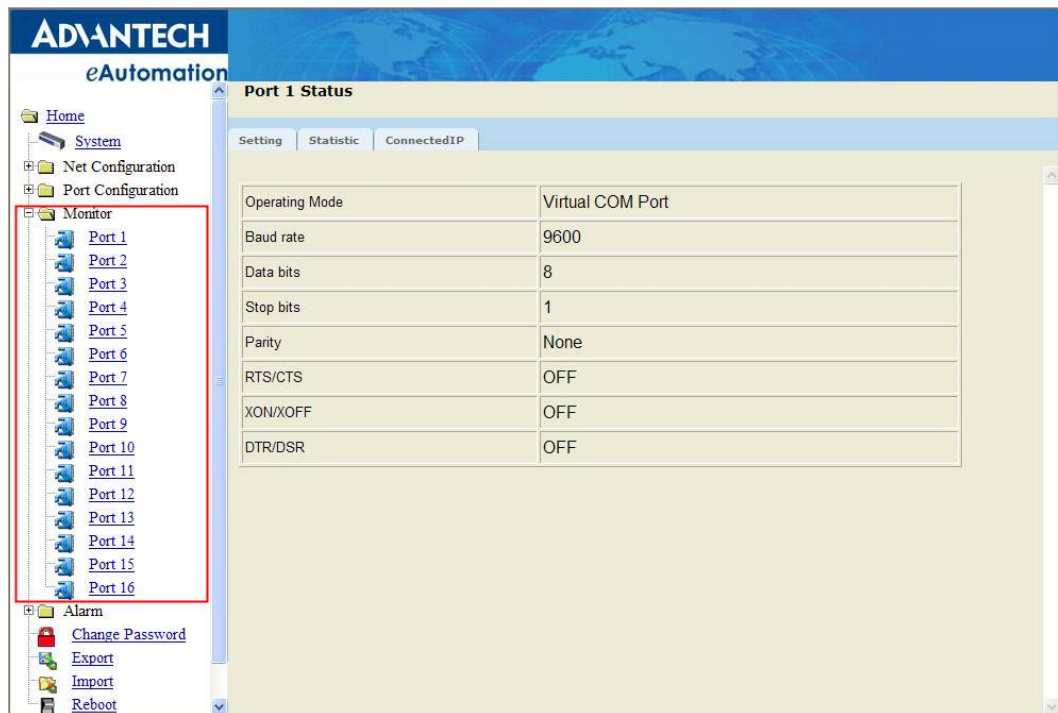

5.5 Port Configuration

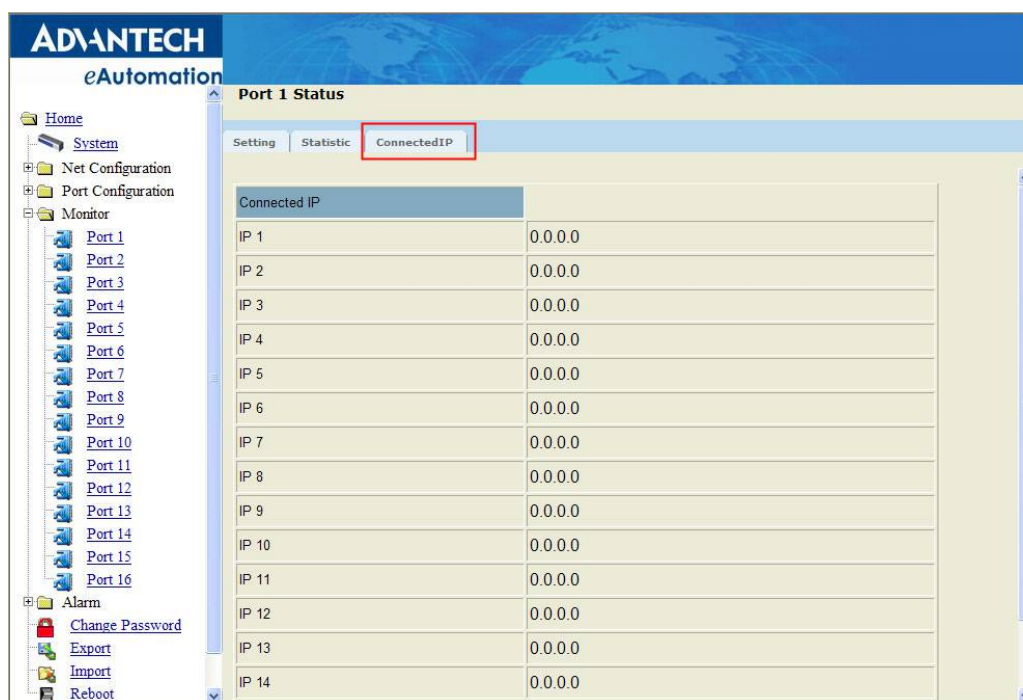

There are Basic, Operation Mode, and Advanced Setting in the serial port configuration. For more detailed information for setting, please refer to chapter 3.4 and chapter 3.5.

5.6 Monitor

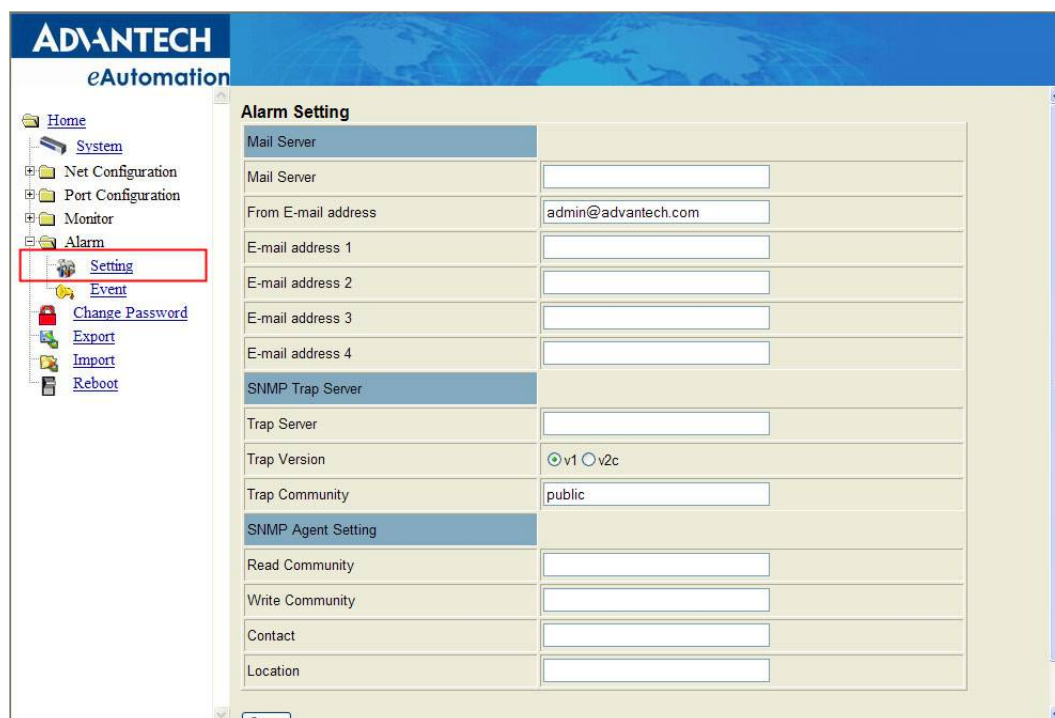

You can monitor the serial ports settings, statistic, and the connected IP address by click on Monitor function on the main menu.

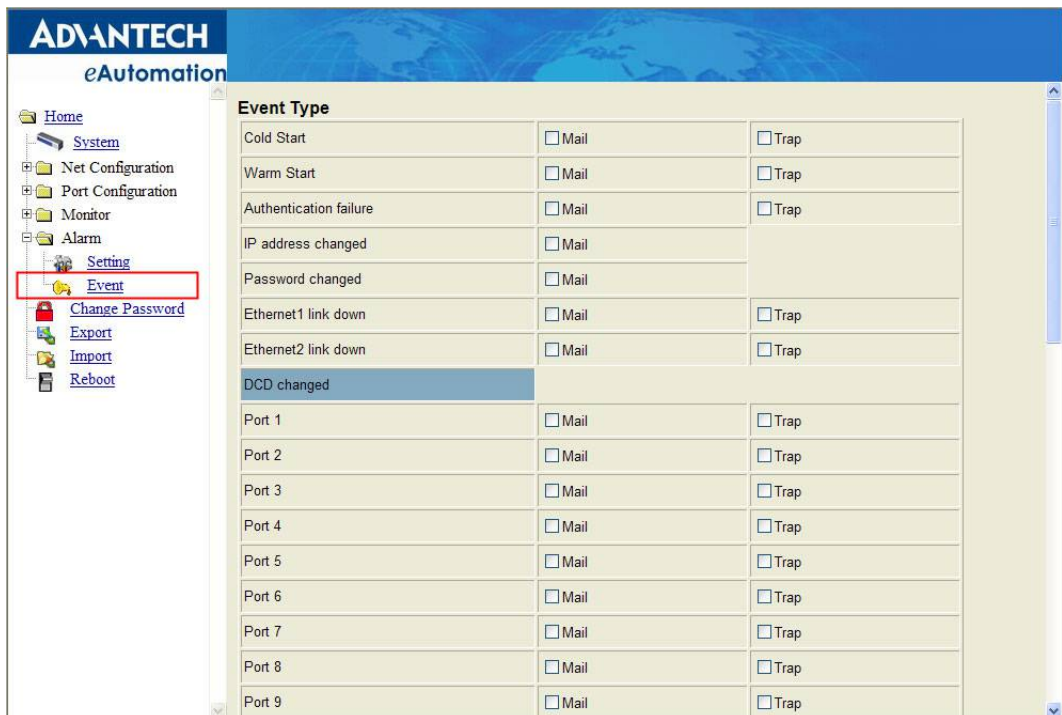

5.7 Auto Warning (Alarm)

You can set the e-mail server and SNMP Trap server in the Setting page, and set the event type in the Event page. For more detailed information for Auto Warning function, please refer to chapter 3.7.

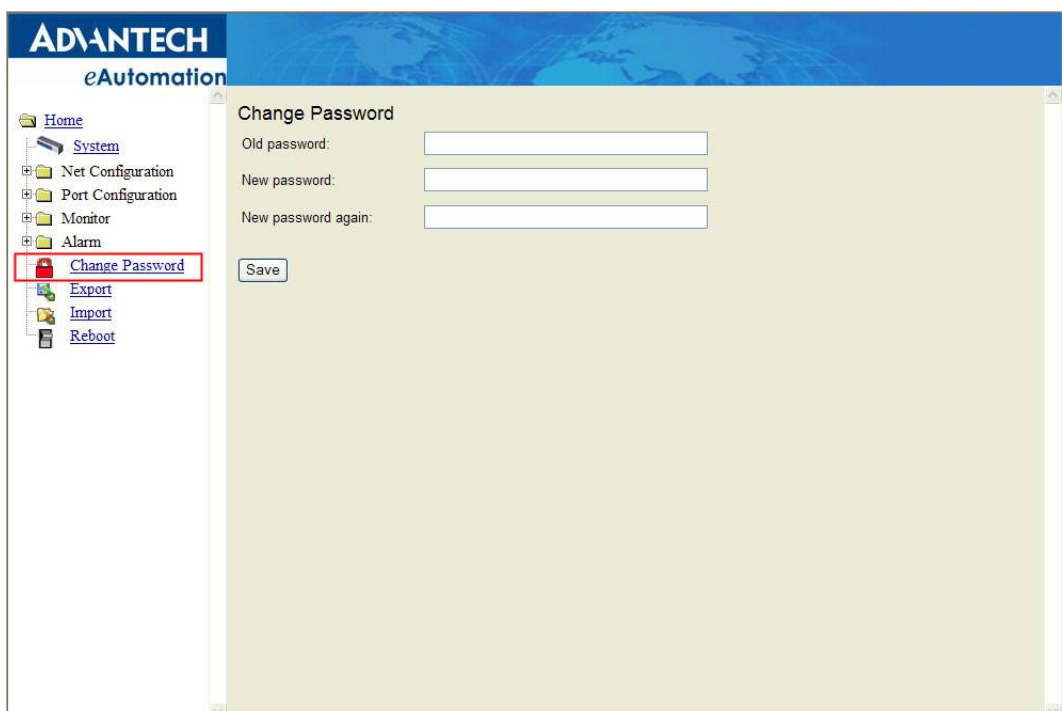

Note! All new configurations will take effect after rebooting. The reboot function is located on the main menu of the Web Configuration.

5.8 Change Password

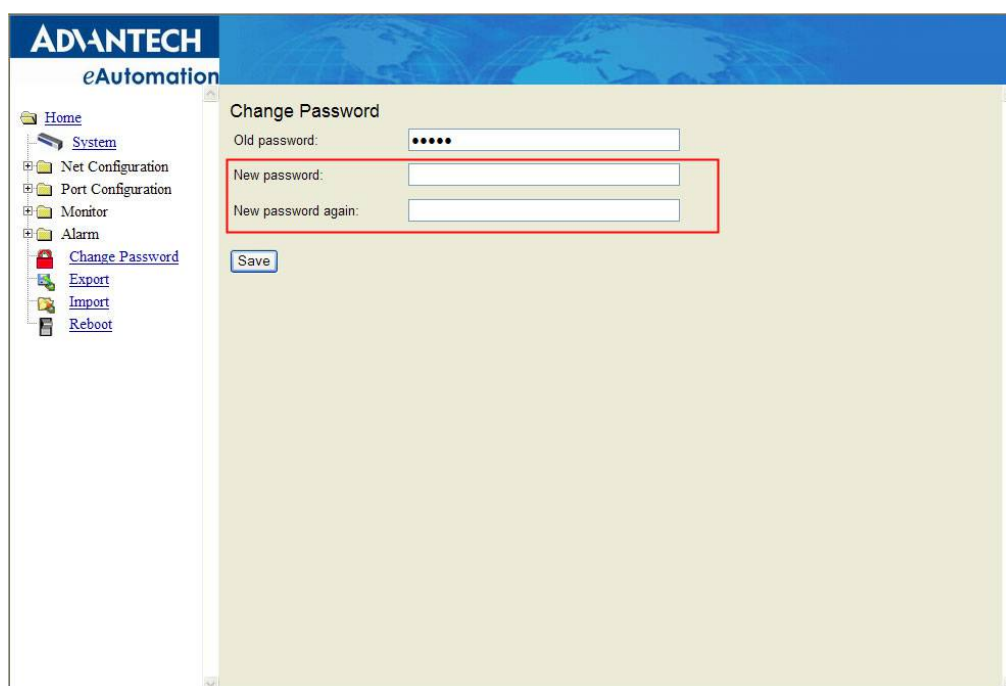

You can change the serial device server password on here:

If you have set a password via the configuration utility or Telnet or serial console, when you access the web configuration, you need to key in the password. Do not need to enter the username in the dialog.

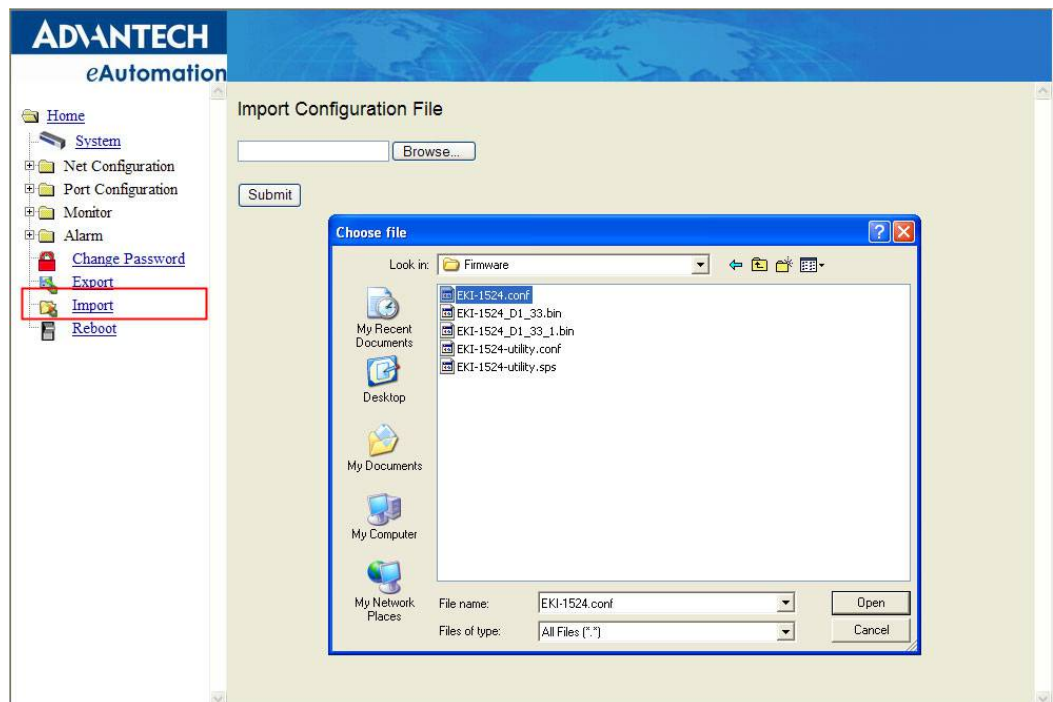

If you want to disable the password protection, just change the password to the default "None" (leave the new password column blank), Be sure to press the "Save" button and reboot the serial device server to make the change effective.

5.9 Import/Export Device Settings

You can Import or Export the serial device server all setting as the “.conf” file format.

5.10 Reboot

The configuration will take effect after clicking “Save” button. But all configurations will save to flash memory after this reboot step. Press the “Reboot” button and the system will give a reset response. It will take a few seconds to reconnect with the new values.

Chapter 6

Telnet Configuration

6.1 Overview

The purpose of the Console Configuration is to help you manage your device in console mode. One of the main functions of the console mode is to change the web configuration login password. You can use terminal software like Hyper Terminal, Telix and other related terminal software.

6.2 Telnet Console

Create a new connection

You can create a new Telnet connection and assign a connection name for the console configuration.

Input the IP address

Confirm that the Telnet console configuration works ok. Be sure that your host PC Ethernet network IP domain is as same as the EKI-152X series serial device server, and the Telnet TCP port number is "23".

Connecting Success

After connection the serial device server in Telnet console mode, you can see the welcome message in the Hyper Terminal Windows.

6.3 Command List

Table 6.1: Console Command List

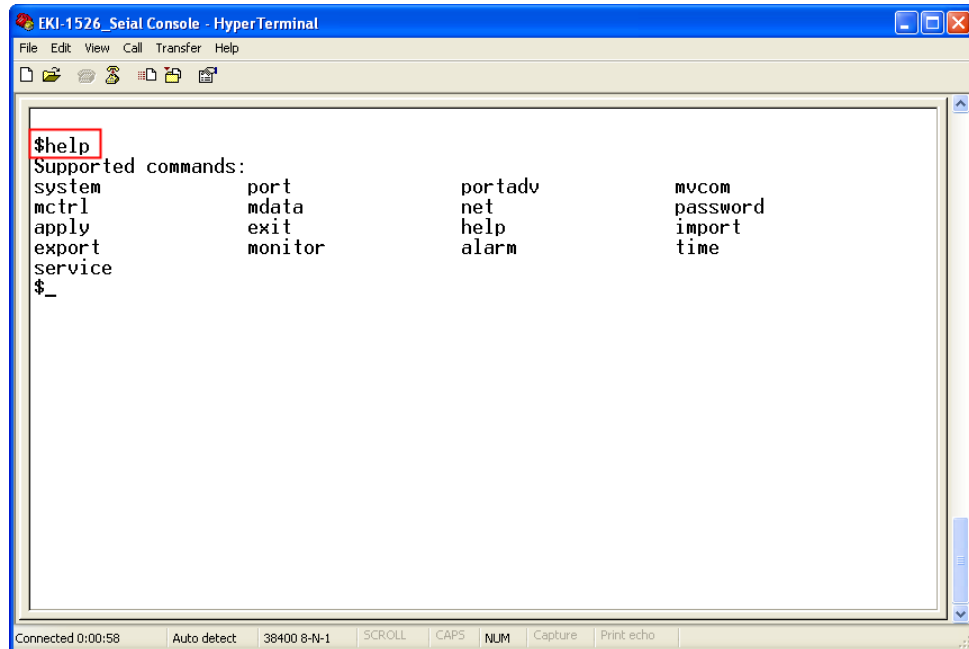

Command	Function Description
system	Show or configure the system information
port	Show or configure the serial ports information
portadv	Show or configure the serial ports advanced settings
mvcom	Show or configure the serial ports in Virtual COM mode
mctrl	Show or configure the serial ports in Control mode (USDG)
mdata	Show or configure the serial ports in Data mode (USDG)
net	Show or configure the Ethernet ports settings
password	Set or change the password
apply	Write settings to the flash memory and reboot the system immediately
exit	Terminate the shell session
help	Display help information of command list
<Tab> <Tab>	Display help information of command list
import	Import the serial device server all settings
export	Export the serial device server all settings
monitor	Monitor the serial ports status
alarm	Show or configure the auto warning functions including mail alarm and SNMP alarm
time	Show or configure the time information
service	Enable or disable the web, Telnet and SNMP functions

Help

You might type the “help” command or press <Tab> twice to show the supported command list.

[Usage] help

[Function] Display help information of command list

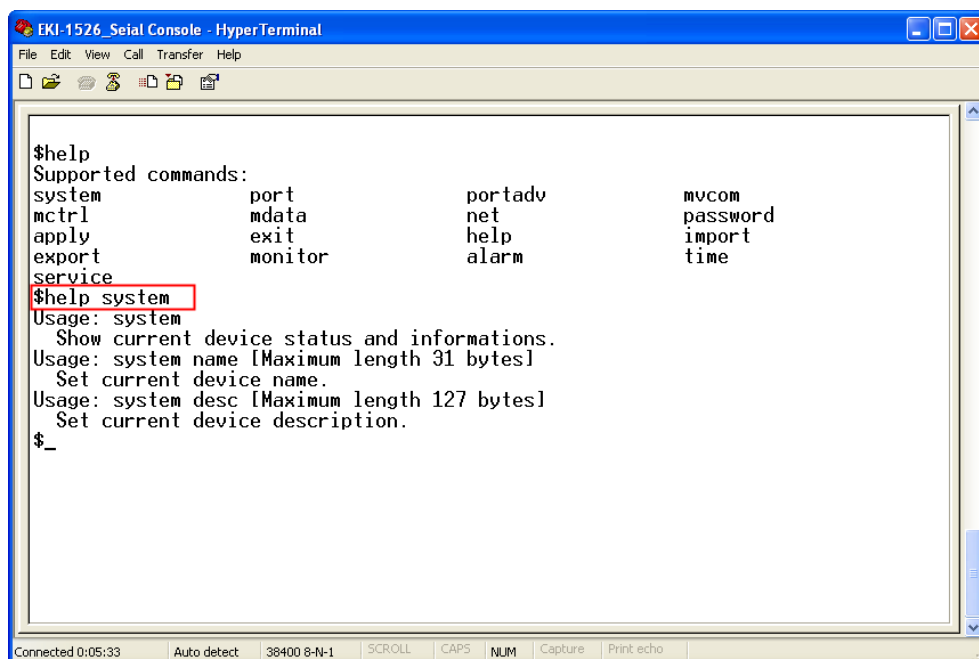

The screenshot shows a HyperTerminal window titled "EKI-1526_Seial Console - HyperTerminal". The menu bar includes File, Edit, View, Call, Transfer, and Help. The command prompt shows "\$help" entered, with the word "help" highlighted by a red box. Below the command, a list of supported commands is displayed in a grid-like format. The status bar at the bottom indicates "Connected 0:00:58" and lists various settings like "Auto detect", "38400 8-N-1", "SCROLL", "CAPS", "NUM", "Capture", and "Print echo".

```
$help
Supported commands:
system      port      portadv    mvcom
mctrl      mdata     net        password
apply       exit      help       import
export      monitor   alarm      time
service
$_
```

You might use “help” command to show the usage of all commands.

[Usage] help [command]

[Function] Show the usage of command

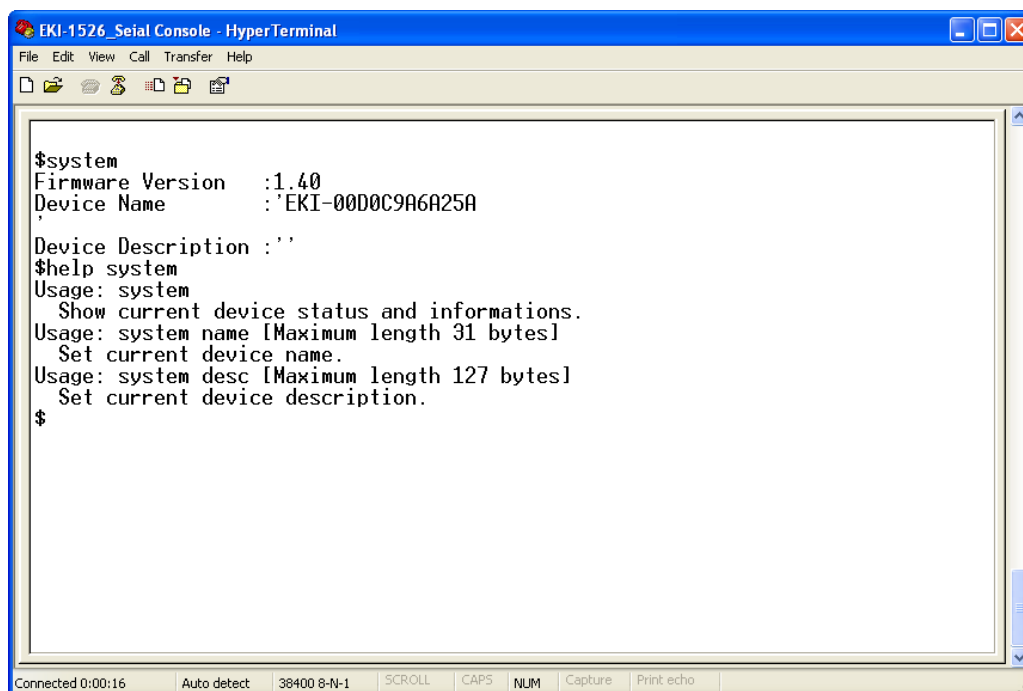

The screenshot shows the same HyperTerminal window. The command prompt now shows "\$help system", with the word "system" highlighted by a red box. Below the command, the usage information for the "system" command is displayed. The status bar at the bottom indicates "Connected 0:05:33" and lists the same settings as the previous screenshot.

```
$help
Supported commands:
system      port      portadv    mvcom
mctrl      mdata     net        password
apply       exit      help       import
export      monitor   alarm      time
service
$help system
Usage: system
  Show current device status and informations.
Usage: system name [Maximum length 31 bytes]
  Set current device name.
Usage: system desc [Maximum length 127 bytes]
  Set current device description.
$_
```

[Usage] system name XXXX

[Function] Set current device name [XXXX: maximum length 31 bytes]

[Usage] system desc XXXX

[Function] Set current device description [XXXX: maximum length 127 bytes]

Port

“Port” is the command to show all serial ports information and configure the serial ports settings.

```
$help port
Usage: port [nn|all]
Show port status and informations.
Usage: port [nn] desc [Maximum length 127 bytes]
Set serial port description.
Usage: port [nn|all] type [232|422|485] flow []
flow 0:None.
flow 1:X0n/X0ff.
flow 2:RTS/CTS.
flow 3:DTR/DSR.
Set serial port type and flow control.
Usage: port [nn|all] baud [50-230400] parity [] data [5-8] stop [1|1.5|2]
acceptable baud: 50 75 110 150 300 600 1200 1800 2400 4800 7200 9600
14400 19200 38400 57600 115200 230400
parity n: None Parity.
parity e: Even Parity.
parity o: Odd Parity.
parity m: Mark Parity.
parity s: Space Parity.
Set serial baud rate, parity and numbers of data bits, numbers of stop bits.
Usage: port [nn|all] mode [vcom|ctrl|data]
Set serial port as virtual COM port or control mode or data mode.
Press any key for continue...
_
```

[Usage] port nn or port all

[Function] Show the “nn”th port or all ports information

```
Set serial port type and flow control.
Usage: port [nn|all] baud [50-230400] parity [] data [5-8] stop [1|1.5|2]
acceptable baud: 50 75 110 150 300 600 1200 1800 2400 4800 7200 9600
14400 19200 38400 57600 115200 230400
parity n: None Parity.
